MEDICATION MONITORING: INTRAVENOUS TO ORAL THERAPEUTIC INTERCHANGE PROGRAM

I. BACKGROUND

The oral route of administration may be ideal so long as the medication achieves the desired concentrations in blood and/or the targeted site(s) of action. Patients often start on parenteral therapy, but as their condition improves, they are often candidates for continuation with oral therapy. Available oral formulations have high oral bioavailability and equivalent potency. The conversion from intravenous (IV) to oral (PO) formulations of the same medication while maintaining equivalent potency is known as "sequential therapy".

Much of the beneficial data on IV to PO therapy interchange stem from the conversion of antimicrobial medications. Studies have shown that appropriate conversion from IV to PO antimicrobial therapy can decrease the length of hospitalization without adversely affecting patient outcome and may improve patient care by reducing the risk of intravascular catheter infection because of shorter line dwell times and less endoluminal contamination.1-8 Additional benefits of IV to PO conversion include reduced hospital cost, greater patient comfort and easier ambulation9. Furthermore, the use of oral medications may decrease nursing personnel time.

II. POLICY

This policy outlines IV to PO conversion considerations and specific criteria for the substitution and therapeutic interchange of medications as set forth by the SHC Pharmacy and Therapeutics Committee, the Antimicrobial Subcommittee, and the Antimicrobial Stewardship Team.

III. PROCEDURES

A. If the patient is being considered for an IV to PO conversion, the clinical pharmacist (and/or Antimicrobial Stewardship Team in the case of antimicrobials) can examine the route of therapy and determine if it is clinically appropriate to perform a sequential, parenteral to oral therapy switch.

B. If the patient meets the approved criteria for transition to oral therapy (Section F), the clinical pharmacist will enter the new order using "per Protocol" order mode and enter a standardized i-Vent in the patient's medical record detailing the conversion.

C. The covering provider will be notified when the sequential switch occurs. The provider has the option to switch back to the intravenous route if parenteral therapy is preferred.

D. The Antimicrobial Stewardship Team will report findings and feedback to the Antibiotic Subcommittee approximately every year.

E. The Pharmacy Department will review and report findings and feedback for non-antimicrobial medications at departmental meetings every quarter for the first year (2013), then every year thereafter.

F. Criteria for patient eligibility:

<table>
<thead>
<tr>
<th>Inclusion Criteria</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patients improving clinically</td>
<td></td>
</tr>
<tr>
<td>• Tolerating food or enteral feeding</td>
<td></td>
</tr>
<tr>
<td>• Able to adequately absorb oral medications via the oral, gastric tube, or</td>
<td></td>
</tr>
</tbody>
</table>
nasogastric tube route

- Not displaying signs of shock, not on vasopressor blood pressure support
- Taking other medications orally

**Additional requirements for antimicrobials:**
- Afebrile for at least 24 hours (temperature ≤100°F or ≤37.8°C)
- Heart rate ≤90 beats per minute
- Respiratory rate ≤20 breaths per minute
- Systolic blood pressure ≥90 mm Hg (without vasopressor drugs)
- Signs and symptoms of infection improvement according to assessment:
  - Improving WBC and differential counts
  - Improving signs and symptoms
  - Hemodynamically stable
  - Patient is not septic

**Exclusion Criteria**

- Persistent nausea and vomiting, diarrhea
- Patient with the following GI conditions:
  - Ileus or suspected ileus with no active bowel sounds
  - Patient is known to have a malabsorption syndrome
  - Proximal resection of small intestines
  - High nasogastric (NG) tube output or requiring continuous GI suction (>500mL/day)
  - Active GI bleed
- Cystic fibrosis
- Patients with Grade III or IV mucositis
- Wernicke's encephalopathy (for thiamine interchange)
- Acute pain (for IV acetaminophen interchange)
- Myxedema coma or if endocrine consulting (for IV levothyroxine)

**Additional exclusions for antimicrobials:**
- Patient has a serious or life threatening infection:
  - Meningitis, endocarditis, intracranial abscesses, osteomyelitis, septicemia, Legionella pneumonia
  - Inadequately drained abscesses and empyema
  - Severely immunocompromised (solid organ transplant, bone marrow transplant)

<sup>1</sup> Serum levels do not consistently correspond to the FAMOTIDINE dose or the degree of gastric acid inhibition
### Multivitamins

| Multivitamins          | 10 mL daily ($6.70) | 1 tablet daily ($0.04) | -  
|------------------------|---------------------|------------------------|---
| Thiamine               | 100mg daily ($9.63) | 100mg daily ($0.02) | 5% 
| • Do not interchange if for Wernicke’s Encephalitis |
| Folic acid             | 1mg daily ($0.04/dose) | 1mg daily ($0.02) | 75-90% 
| Potassium Chloride     | 20mEq daily ($1.26) | 20meq daily ($0.35) | - 
| Levothyroxine          | 0.05mg daily ($51.85/dose) | 0.1mg daily ($0.15/dose) | 40-80% 
| • Do not interchange if for myxedema coma or if endocrine consulting |
| Metoclopramide         | 10mg q6hr prn ($0.40/dose) | 10mg q6h prn ($0.11/dose) | 80% 
| Ondansetron            | 4mg q6h prn ($0.63) | Tablet ($0.18) | 56% 
| *Reminder: proper conversion is usually 1:2 IV to PO, unless otherwise noted, e.g. endocrine recommendations |

### Antimicrobial Intravenous to Oral Dose Conversion
