**RESEARCHER PROFILES** 29-141
I couldn’t be prouder of the Stanford Cardiovascular Institute. Since its inception in 2004, the institute has established a legacy of groundbreaking research, outstanding education, and preeminent patient care. And its transformative work in 2019 only served to continue its excellence.

Led by Joseph C. Wu, MD, PhD, the Simon H. Stertzer, MD, Professor of Cardiovascular Medicine and of Radiology, and Robert Harrington, MD, the Arthur L. Bloomfield Professor of Medicine and Chair of the Department of Medicine, the Cardiovascular Institute is a collaborative force. Its members — a diverse and talented team of engineers, surgeons, physicians, scientists, fellows, and students — are committed to improving cardiovascular health and developing the leaders of tomorrow.

The far-reaching impact of their dedication is demonstrated in just a few of the many headlines the Cardiovascular Institute generated this past year:

- The landmark Apple Heart Study laid the foundation for future large-scale app-based clinical studies by showing that wearable technology can safely identify heart rate irregularities.
- The number of invasive procedures may soon decline thanks to a finding that stents and bypass surgery show no benefit over medication and lifestyle advice in treating patients with severe but stable heart disease.
- As e-cigarette use skyrockets, the institute found flavoring liquid used in electronic cigarettes may increase the risk of cardiovascular disease when inhaled.
- In a first-of-its-kind study, the institute took heart muscle cells derived from stem cells to the International Space Station to understand how microgravity affects the cells of the human heart.

At the same time, the institute continued to strengthen collaborative relationships and create innovative partnerships. The Stanford–Penn Symposium brought together more than 300 attendees to promote interinstitutional sharing, and more than 500 people from industry and academia met at the institute’s 4th Annual Drug Discovery Symposium.

Beyond these critical exchanges of knowledge, the future of cardiovascular health will be in good hands. The institute’s undergraduate summer program hosted 19 students for an intense 10 weeks to explore a future in cardiovascular research. The most important job we have at Stanford is to inspire and encourage young people.

I am excited to see what the Stanford Cardiovascular Institute accomplishes in 2020 as it continues to lead the field of cardiovascular medicine.

Lloyd B. Minor, MD
Director’s Letter

Stanford Cardiovascular Institute (CVI) was established in 2004 to bring together trainees, scientists, engineers, and some of the brightest cardiologists and cardiac surgeons in the field. Together, the members of the Cardiovascular Institute embody valuable collaborative spirit and an open-minded philosophy that have driven innovation and yielded incredible biomedical advances, as evidenced by over 2,000 manuscripts published by our members in 2019 alone. In this report, we highlight the contributions from our members, which now number more than 260 Stanford faculty members and hundreds of the brightest fellows and students in the country.

The core strength of the CVI comes from our talented students and postdoctoral and clinical fellows. Their training and professional development are a top priority of the Institute to ensure continued success throughout their time at Stanford and thereafter. We are fortunate to support 16 fellows each year on NIH training grants and provide grant writing support for all fellows to pursue their own funding opportunities. We also aim to facilitate an active exchange of ideas across disciplines and training levels. To achieve this, we have a Frontiers of Cardiovascular Science seminar that features international leaders in the field, and we host an annual Stanford Drug Discovery Symposium that attracts diverse leaders in academia, industry, and government. We are very excited to announce our upcoming relocation to the new Biomedical Innovations Building, designed to be a hub for cardiovascular scientists to work side-by-side and actively collaborate. We are continuing to lead important conversations within and outside the cardiovascular community at Stanford to promote fruitful collaborations across all facets of science.

As an academic institution, we are committed to ensure the professional growth and the development of scientific curiosity among all of our trainees. To that end, we appreciate greatly the generous endowment of the Dorothy Dee and Marjorie Helene Boring Trust, which supports Stanford medical students dedicated to cardiovascular research, and the Lawrence H. and Roberta Cohen Lectureship from the generous donations by the late Dr. Lawrence Cohen as a tribute to Dr. Norman Shumway’s pioneering work in cardiovascular medicine. In partnership with the Maternal and Child Health Research Institute and the Steven M. Gootter Foundation, the CVI awarded eleven seed grants to launch the most creative and impactful projects that are in line with the Cardiovascular Institute’s innovative spirit. We were also extremely fortunate to receive a generous endowment from Joan and Sanford I. Weill to provide support for faculty selected as CVI Weill Research Scholars, based on the merits of their research and academic scholarship.

As the Cardiovascular Institute Director, I am tremendously proud of the transformative advances in knowledge and novel approaches to cardiovascular disease therapy that our members and collaborators have been able to achieve.

Joseph C. Wu, MD, PhD
Leadership

**Joseph C. Wu, MD, PhD**  
Director, Stanford Cardiovascular Institute  
Simon H. Stertzer, MD, Professor of Medicine and Radiology

Executive Committee

The Stanford Cardiovascular Institute Executive Committee oversees Cardiovascular Institute operations. Its members represent cardiovascular research, education, and clinical care, ensuring that the Cardiovascular Institute remains the home for cardiovascular research at Stanford. The committee is comprised of Stanford experts in different disciplines listed below.

**Basic Research**
- Ronglih Liao, PhD
- Mark Mercola, PhD
- Mark Nicolls, MD
- Marlene Rabinovitch, MD

**Cardiovascular Imaging**
- Dominik Fleischmann, MD
- Koen Nieman, MD, PhD

**Cardiovascular Medicine**
- Eldrin F. Lewis, MD, MPH
- Thomas Quertermous, MD
- Alan C. Yeung, MD

**Cardiothoracic Surgery**
- Y. Joseph Woo, MD

**Clinical Research**
- William Fearon, MD
- Kenneth W. Mahaffey, MD

**Education and Training**
- Daniel Bernstein, MD
- Mark Mercola, PhD

**Finance and Administration**
- Jason Irwin, MBA
- Stefan Pavlovic, MBA

**Innovation**
- Paul Yock, MD

**Junior Faculty Development**
- Patricia Ngyuen, MD
- Edda Spiekerkoetter, MD

**Outcome & Prevention**
- Mark Hlatky, MD
- Marcia Stefanick, PhD
- Paul A. Heidenreich, MD, MS

**Translational Research**
- Philip S. Tsao, PhD
- Sean M. Wu, MD, PhD

**Vascular Surgery**
- Ronald L. Dalman, MD
- Nicholas Leeper, MD
The CVI Steering Committee is responsible for providing guidance on the overall strategic direction of the institute. This advisory committee, which includes representatives from the major areas of cardiovascular disease research and clinical care, provides support, guidance and oversight of progress on CVI objectives and initiatives.

Education & Training Committee

The Cardiovascular Institute Education and Training Grant Committee oversees and defines the educational goals of the Cardiovascular Institute. The committee reflects multiple specialties of cardiovascular medicine and research, including surgery, pulmonary, development, genomics and engineering. The Institute strives to provide students and fellows with an atmosphere of growth and mentorship throughout their careers at Stanford.

Euan A. Ashley, MCRP, DPhil
Professor of Medicine (Cardiovascular), of Genetics and, by courtesy, of Pathology

Stanford CVI Human iPSC Biobank Service

Normal and patient-derived reprogrammed cardiomyocytes are a tremendous resource for researchers and physicians here at Stanford and around the country. Understanding the disease process directly at the population level and observing these cells as surrogates under a myriad conditions has the potential to be a game-changer for cardiovascular medical research.

SCVI biobank is supported in part by National Heart, Lung and Blood Institute (NHLBI) and the Stanford Cardiovascular Institute (CVI).

Contact: Joseph Wu, MD, PhD / joewu@stanford.edu or Biobank manager, Yan Zhuge, PhD / yanzhuge@stanford.edu with any questions.

Clinical Biomarker & Phenotyping Core Lab (BPCL)

BPCL provides quantitative assessment of clinical cardiovascular phenotypes for translational research and clinical trials. These cardiovascular phenotypes include evaluating cardiac structure and function, measuring carotid intimal thickness and arterial stiffness, and testing endothelial function and cardiopulmonary exercise testing.

In collaboration with the Human Immune Monitoring Center at Stanford and members of the Cardiovascular Institute, we also offer central blood processing and banking capabilities. In addition, we develop new biomarker platforms and imaging modalities.

Contact: Francois Haddad, MD / fhaddad@stanford.edu

3DQ Imaging Laboratory

Stanford’s 3DQ Imaging Laboratory develops new approaches to exploration, analysis and quantitative assessments of diagnostic images that result in new and/or more cost-effective diagnostic approaches, and new techniques for the design and monitoring of therapy. The lab processes over 1,200 clinical cases to deliver relevant visualization and analysis of medical imaging data at Stanford. The lab is co-directed by Dominik Fleischmann, MD, Roland Bammer, PhD and Sandy Napel, PhD. Contact: Dominik Fleischmann, MD / d.fleischmann@stanford.edu

CVI Clinical Trials Core

The CVI Clinical Trials Core provides full spectrum of support to CVI members and their clinical trials. The coordinators has extensive clinical research experience in both industry and academia. The team provides services and support to principal investigators and sponsors, including:

- Consultation
- Study start-up management, including IRB applications, budget development
- Subject recruitment, site visits, and follow-ups (AE reporting and queries)
- Data management
- Regulatory compliance and documentation
- Closeout

Contact: Ed Finn, Clinical Trials Manager at efin@stanford.edu

Cardiovascular Pharmacology (BioADD)

The Cardiovascular Pharmacology/Biomaterials and Advanced Drug Delivery (BioADD) Laboratory is a cutting edge research facility that specializes in the creation of biomaterials and drug delivery agents. The lab lends its expertise toward designing and analyzing biomaterials, developing drug delivery devices and formulations, pharmacokinetic and pharmacodynamic studies, and developing smart materials for biomedical applications. The CVI Cardiovascular Pharmacology also offers trainings and lectures.

Contact: Jayakumar Rajadas, PhD jayraja@stanford.edu
Education & Training Programs

The Stanford Cardiovascular Institute offers a unique platform to train the next generation of basic and translational scientists by exposing them to cardiovascular imaging research, mechanisms, and innovations in vascular disease and myocardial biology. Mentors for the programs are drawn from members of this collaborative Institute, including faculty in medicine, materials science, bioengineering, imaging, and health research and policy.

Mechanisms and Innovation in Vascular Disease

PROGRAM DIRECTORS
Philip Tsao, PhD and Nicholas Leeper, MD

The Mechanisms & Innovation in Vascular Disease program (T32) trains a total of six fellows over two years through an NIH training grant in the following areas of vascular medicine & research: Vascular Reactivity & Thrombosis, Vascular Regeneration & Development, Metabolic or Lifestyle Influences on Vascular Outcomes, Proteomic Markers & Genetic Determinants of Vascular Disease, Gender & Ethnicity Differences in Vascular Disease, and Vascular Bioengineering. Twenty-nine faculty mentors from eighteen different departments within the School of Medicine and the University provide a variety of angles from which to address fundamental questions about vascular disease.

ALEXANDER KAISER, PHD
Project: Personalized Virtual Surgery for Precision Treatment of Hypertrophic Cardiomyopathy

XIAOMING OUYANG, PHD
Project: Modeling Tyrosine Kinase Inhibitor-Induced Vascular Dysfunction Using Human iPSCs

STEPHANIE LINDSEY, PHD
Project: Quantification and Optimization of Tissue Engineered Vascular Graft Growth and Remodeling

KENNETH TRAN, MD
Project: Patient Specific Computational Hemodynamic Performance Modelling in Complex EVAR

MARCELLA MARTIN, PHD
Project: Defining the Role of Endothelial Cell Dysfunction in William’s Syndrome using iPSCs

IAN WILLIAMS, PHD
Project: Investigating the Role of Blood Flow in Coronary Vascular Remodeling

If interested in this postdoctoral training grant visit to apply: http://med.stanford.edu/cvi/education/mechanisms-and-innovations-t32.html
Multi-Disciplinary Program in Cardiovascular Imaging

PROGRAM DIRECTORS
Joseph C. Wu, MD, PhD, John Pauly, PhD, and Koen Nieman, MD, PhD

The Multi-Disciplinary Training Program in Cardiovascular Imaging (T32) at Stanford is funded by the National Institute of Biomedical Imaging and Bioengineering of the National Institutes of Health. The program is designed to train the next generation of CV imaging investigators by exposing them to three complementary areas – clinical, engineering, and molecular imaging. The program trains a total of four fellows in three complementary areas: Clinical, Engineering, and Molecular Imaging. With the impact of cardiovascular disease on US and world health and the rapid advances in imaging technologies and cardiovascular biology, it is critical that fellows be provided a broad, multi-disciplinary, and collaborative training program to foster their ability to translate CV imaging research into clinical applications. The faculty mentors are a critical component of the program, with a balance of MD and PhD mentors across the core collaborative departments.

SANGKYUN 'SANG' CHO, PHD
Project: Reversal of Myofibroblast Differentiation and Cardiac Fibrosis by Cooperative Chemo-mechanical Signaling

GENNIFFER SMITH, PHD
Project: Risk Stratification of Atherosclerotic Plaques Through DNA Methylation Profiling

FATEMEH OSTADHOSSEIN, PHD
Project: Smart Nanoprobes for the Detection of Hypoxic Regions in Ischemia, Teratoma Formation, and Stem Cell Apoptosis

RAHEL A. WOLDEYES, PHD
Project: Visualizing the Structures and Subcellular Organization of Macromolecules Inside Cardiomyocytes Using Cryo-Electron Tomography

If you are interested in this postdoctoral training grant visit to apply: http://med.stanford.edu/cvi/education/cardiovascular-imaging-t32.html.
Research Training in Myocardial Biology

**PROGRAM DIRECTORS**
Daniel Bernstein, MD, Thomas Quertermous, MD, and Euan Ashley, MRCP, DPhil

Myocardial biologists at Stanford are found in diverse departments and divisions, providing a natural vehicle for multidisciplinary training. This T32 training grant program is funded by the National Institutes of Health to bring together post-doctoral fellows and faculty from six complementary areas – genetics and genomics, cellular signaling and molecular imaging, physiology and cardiac development and regeneration, outcomes research and population science.

Assistant Professor at The Ohio State University & Principal Investigator at Nationwide Children's Hospital
The Stanford Cardiovascular Institute has been awarded an R38 StARR (Stimulating Access to Research in Residency) grant as of February 2020. This is its inaugural year!

Funded by the NHLBI, this multidisciplinary resident training grant is designed to recruit and train resident-investigators in cardiovascular and pulmonary research and to accelerate their development into independent clinician-investigators. This program is designed for individuals who have completed a significant portion of their clinical training (~2 years), and interested in becoming physician scientists, and have developed a clinical and research focus.

Residents will be selected from Internal Medicine, Radiology, Pediatrics, and Cardiothoracic Surgery residency programs here at Stanford School of Medicine.

Deadline for application is March 1, 2020. Start date of award is July 1, 2020.

To apply: https://tinyurl.com/R38CVI.

Our undergraduate summer research program is supported by the American Heart Association (AHA), the NHLBI R25 Diversity in Health-Related Research grant, and the Stanford CVI.

The 10-week-long program is designed to train rising sophomores, juniors, and seniors (enrolled in a 4-year undergraduate program in the U.S. and territories) that are majoring in a scientific discipline exposure to cardiovascular research in the laboratories of CVI-affiliated faculty members.

Each student receives a set stipend covering living costs. The program dates will be between June 8, 2020, and August 14, 2020. During their individual research mentorships, the program also hosts events fostering student interaction, including: a visit to local Silicon Valley biotech company, meeting with a panel of faculty mentors and peers discussing career opportunities in cardiovascular science, and to present their work with formal research presentations during an Undergrad Research event.

For its inaugural year (2018), this program hosted 7 students from around the country. Last year (2019), CVI hosted 19 undergraduate students; and we are recruiting for 20 spots this year.

The deadline for submission for this summer is March 15, 2020. Applications and additional information can be found here: https://tinyurl.com/cviundergradinfo.

Questions? Contact: preston@stanford.edu or chaseama@stanford.edu.
The Impact of Philanthropy

Steven M. Gootter Foundation: Sudden Cardiac Death Research

The support from the Steven M. Gootter Foundation allows seed funding of research projects that advance current knowledge of sudden cardiac death (SCD) such as development of molecular tests that can identify genetic mutations associated with SCD. Hypertrophic cardiomyopathy, in which a portion of the myocardium is thickened, is the most common cause of sudden death in the United States. The Foundation supports an annual lecture on Sudden Cardiac Death and Electrophysiology, Seed Grant research projects (below), and other ongoing efforts.

CVI Weill Research Scholars Endowment

With an extraordinary gift of $4 million from Joan and Sanford I. Weill, the CVI Weill Research Scholars endowment has been established to provide faculty research support in perpetuity. Education and partnership are at the heart of the Weills’ passion for philanthropy and their dedication to making long term commitments to the organizations they support. The inaugural CVI Weill Scholars are Ronglih Liao, PhD; Mark Mercola, PhD; and Sean Wu, MD, PhD.

Ronglih Liao, PhD
Professor of Medicine (Cardiovascular Medicine)

Mark Mercola, PhD
Professor of Medicine (Cardiovascular Medicine)

Sean M. Wu, MD, PhD
Associate Professor of Medicine (Cardiovascular Medicine) and Associate Professor (by courtesy), Pediatrics

Supporting CVI

The support from our donors is critical for the Institute to provide a wide variety of programs to advance investigation of cardiovascular disease and development of innovative patient care programs.

To learn more about how you can support the Stanford Cardiovascular Institute please contact:

Lawrence H. and Roberta Cohn Endowed Lectureship

The Lawrence H. and Roberta Cohn endowed lectureship, held annually in the area of cardiothoracic surgery, brings together physician-scientists from around the country to Stanford. Dr. Cohn graduated from Stanford School of Medicine in 1962, training under Dr. Norman Shumway. Dr. Cohn was a pioneer in the field of heart valve repair and replacement surgery. Past keynote lecturers include: David Adams, MD (2015); Tomislav Mihaljevic, MD (2016); Joseph Coselli, MD (2017); Frederick Y. Chen, MD, PhD (2018); and Tirone E. David, MD (2019).
The Stanford Cardiovascular Institute has provided over $2.8 million in seed funding to support cardiovascular research and innovation. Our goal is to ignite and support new ideas that will change how we diagnosis and treat cardiovascular diseases. Together with Stanford Maternal and Children's Health Research Institute (MCHRI) and the Gootter Foundation, the CVI is excited to support research for 11 outstanding projects in 2020.

**Research Funded by Maternal & Child Health Research Institute**

**PIs:** Sushma Reddy, MD  
**Co-Investigators:** Daniel Bernstein, MD; Jingjing Li, PhD  
*A Non-invasive Signature of Myocardial Signaling in Children with Single Ventricle Heart Failure*

**PIs:** Francois Haddad, MD; Myriam Amsallem, MD, PhD; Jeffrey Feinstein, MD, MPH  
**Co-Investigators:** Alison Marsden, PhD; Roham T. Zamanian, MD; David Ouyang, MD  
*Developing Novel Computational Methods for the Early Detection of Right Heart Failure and Pulmonary Hypertension in the Pediatric and Adult Populations*

**Research Funded by Stanford Cardiovascular Institute**

**PIs:** Ioannis Karakikes, PhD; Kevin Wang, MD, PhD  
*CRISPR-mediated Therapy for Cardiac Laminopathies*

**PIs:** Nicholas Leeper, MD; Ying Wang, PhD  
*Identify 'Atherogenic' Somatic Mutations/Epigenetic Modifications in Vascular Smooth Muscle Cells*

**PIs:** Kari Nadeau, MD, PhD; David T. Paik, PhD  
**Co-Investigators:** Lei Tian, PhD  
*Single-cell Sequencing to Identify Air Pollution-Induced Cardiac Risks*

**Research Funded by the Steven M. Gootter Foundation**

**PI:** Paul Wang, MD  
**Co-Investigators:** Duy Nguyen, MD; Anson Lee, MD; Moham N. Viswanathan, MD; Nitish Badhwar, MD; Sanjiv Narayan, MD; Oscar J. Abilez, MD, PhD; Phillip Yang, MD; Meghedi Babakhanian, PhD; Terrance Pong, MD; Paul A. Chang, MD  
**Experimental Heart Models of Ventricular Tachycardia: Porcine and Explanted Human Heart**

---

**Research Funded by Stanford Cardiovascular Institute**

**PI:** Marlene Rabinovitch, MD; **Co-Investigators:** Michael Snyder, PhD; David Marciano, PhD; Jan-Renier Moonen, MD, PhD  
**Exploring Genomic Mosaicism in Pulmonary Arterial Hypertension Patient Lungs**

---

**PI:** Phillip Yang, MD  
**Co-Investigator:** Utkan Demirci, PhD; Katrin Svensson, PhD  
**Proteomic Analysis of iPSC-derived Extracellular Vesicles for Mitochondrial Biogenesis**

---

**PI:** Elsie G. Ross, MD;  
**Co-Investigators:** Nigam Shah, MBBS, PhD; Nicholas J. Leeper, MD; Erik Ingelsson, MD, PhD; Philip Tsao, PhD  
**Development of a Precision Screening Platform for Peripheral Artery Disease Using Electronic Health Records and Polygenic Risk Scores**

---

**PIs:** Jennifer Tremmel, MD; Patricia Nguyen, MD; **Co-Investigators:** Vedant Pargaonkar, MD; Thomas Quertermous, MD  
**Whole Exome Sequencing Study of Coronary Microvascular Dysfunction in Patients with Angina in the Absence of Obstructive Coronary Artery Disease**

---

**PIs:** Ronald Witteles, MD; Euan A. Ashley, MRCP, PhD; Kevin Alexander, MD; **Co-Investigator:** Francois Haddad, MD; Paul Cheng, MD, PhD; David Ouyang, MD  
**Precision Approach to Ventricular Mass: Image-Based Differentiation of Hypertrophic Cardiomyopathy, Amyloidosis, and Phenocopies**
Past Seed Grant Awardees: 2018-2019

Multiparametric Imaging to Study Cellular Dynamics in Duchenne Muscular Dystrophy-associated Dilated Cardiomyopathy
Helen Blau, PhD, The Donald E. and Delia B. Baxter Foundation Professor and Director, Baxter Laboratory for Stem Cell Biology
Yu Xin Wang, PhD, Postdoctoral Research Fellow, Microbiology and Immunology
Collaborators: Mingxia Gu, MD, PhD; Marlene Rabinovitch, MD
This research was funded by MCHRI

Identification of Metabolic Markers During Early Pregnancy Associated With the Risk of Congenital Heart Defects in the Offspring
Michael Snyder, PhD, Stanford W. Ascherman, MD, Professor in Genetics
Mads Melbye, MD, Visiting Professor, Medicine - Primary Care and Population Health
Collaborator: Liang Liang, PhD, Postdoctoral Research Fellow, Genetics
This research was funded by MCHRI

Functional Characterization of Distinct Bone Marrow Sub-Fractions for Treatment of Myocardial Infarction
Charles K. F. Chan, MD, Assistant Professor of Surgery (Plastic and Reconstructive Surgery)
Irving Weissman, MD, Director, Stanford Institute for Stem Cell Biology and Regenerative Medicine, Virginia & D. K. Ludwig Professor for Clinical Investigation in Cancer Research, Professor of Developmental Biology
Patrici K. Nguyen, MD, Assistant Professor of Medicine (Cardiovascular Medicine) at the Palo Alto Veterans Affairs Health Care System
Collaborator: Andrew Lee

Novel Intravascular Ultrasound Array Catheter for Quantitative Imaging of Vulnerable Plaque
Jeremy Dahl, PhD, Associate Professor of Radiology (Pediatric Radiology)
Matthew Lungren, MD, MPH, Assistant professor of Radiology (Pediatric Radiology)
Collaborator: Arsenii Telichko, PhD, Postdoctoral Research Fellow, Radiology; Carl Herickhoff, PhD, Research Engineer, Radiology (Pediatric Radiology)

Anesthetics Induced Myocardial Depression Through TRPA1 Signaling Pathway
Detlef Obal, MD, PhD, Clinical Assistant Professor, Anesthesiology, Perioperative and Pain Medicine
Collaborator: Ian Ying-Li Chen, MD, PhD, Staff, Cardiovascular Institute Operations, Resident, HS-Medicine-SHC

Genome-scale CRISPR Interference Approach to Investigate Statin-induced Myotoxicity
June-Wha Rhee, MD, Clinical Instructor of Medicine (Cardiovascular Medicine)
Stanley Qi, MD, Assistant Professor of Bioengineering
Collaborator: Masataka Nishiga, MD, PhD, Postdoctoral Research Fellow, Cardiovascular Institute

Influence of E-cigarette Vapor on Experimental Aortic Aneurysm
Philip Tsao, PhD, Professor (Research) of Medicine (Cardiovascular Medicine)
Collaborators: Joshua M. Spin, MD, PhD, Clinical Assistant Professor, Medicine (Cardiovascular Medicine); Ronglih Liao, PhD, Professor of Medicine (Cardiovascular Medicine); Nicholas J. Lepere, MD, Professor of Surgery (Vascular Surgery) and Medicine (Cardiovascular Medicine); Juyong Brian Kim, MD, Instructor of Medicine (Cardiovascular Medicine)

Characterization of the Gut Microbiome-Host Metabolome Interactions in Heart Failure-Related Insulin Resistance
Michael Fowler, MB, FRCP, Professor of Medicine (Cardiovascular Medicine)
Petra Mamic, MD, Fellow in Medicine, Cardiovascular Medicine
Collaborators: Michael Snyder, PhD, Stanford W. Ascherman, MD, Professor in Genetics; Thomas Quertermous, MD, William G. Irwin Professor in Cardiovascular Medicine

A Bioabsorbable External Mesh to Prevent Vein Graft Failure After Coronary Artery Bypass Graft Surgery
Alison Marsden, PhD, Associate Professor of Bioengineering, Pediatrics (Cardiology), and by courtesy, of Mechanical Engineering
Jack Boyd, MD, Clinical Associate Professor, Cardiothoracic Surgery
Collaborators: Michael Snyder, PhD, Stanford W. Ascherman, MD, Professor in Genetics; and Francois Haddad, MD (Medicine/Cardiology)

Does Enhancing Coronary Artery Development Promote Recovery From Cardiac Injury?
Kristy Red-Horse, PhD, Assistant Professor of Biology
Collaborators: Daniel Bernstein, MD, Alfred Woodley Salter and Mabel Smith Salter Endowed Professor in Pediatrics

Evaluation of Orphan G-protein-coupled Receptor GPR151 as a Novel Obesity Drug Target
Erik Ingelsson, MD, PhD, Professor of Medicine (Cardiovascular Medicine) and, by courtesy, of Health Research and Policy
Collaborators: Mark Mercola, PhD, Professor of Medicine, Cardiovascular Medicine

Seed grants are essential for opening doors to discovery. With this support, our investigators can pursue their boldest ideas and shift paradigms to create new treatments for cardiovascular disease. Stanford revolutionized heart treatment before, and we are poised to do it again.

—Joseph C. Wu, MD, PhD
Dorothy Dee & Marjorie Helen Boring Trust Medical School Student Research Award

Through a generous $2.2 million gift from the Dorothy Dee and Marjorie Helene Boring family, the Stanford Cardiovascular Institute awards medical students with demonstrated excellence and dedication to cardiovascular medicine at Stanford.

NICOLAS QUACH
MS2 / Cardiothoracic Surgery
Project: Engineering a Supra-therapeutic C-X-C Chemokine Receptor Type 4 (CXCR4) Agonist to Prevent Ischemic Heart Failure
Mentor: William Hiesinger, MD

TING HSUAN WU
MS2 / Pulmonary and Critical Care Medicine
Project: Single-cell Analysis of Inflammation-induced Pulmonary Hypertension in Bmpr2 Dysfunction
Mentors: Mark Nicolls, MD and Peter Kao, MD, PhD

SAAD SYED
MS3 / Pediatric Cardiology
Project: A Non-invasive Signature of Myocardial Signaling in Children with Single Ventricle Heart Failure
Mentor: Sushma Reddy, MD

PAST Awardees
2018 Recipients: Kevin Cyr, Yuhao "Danny" Huang, and Annika Dries
2017 Recipients: Joetsaroop Bagga, Veronica Toro, Angela Zhang, and Xinyan "Lisa" Zhang
2016 Recipients: Aditya J. Ullal, Francisco Xavier Galdos, Andrew Lee, and Raheel Ata
2015 Recipients: Charlotte Rajasingh, and Christopher Jensen

We are very grateful for this generous endowment by the Boring Family Trust. Philanthropy enhances our educational mission and helps support the best and brightest young trainees within the Cardiovascular Institute.

— Joseph C. Wu, MD, PhD, Director, Stanford Cardiovascular Institute
The Frontiers in Cardiovascular Science lecture series is the flagship colloquium of the Stanford Cardiovascular Institute. Distinguished local, national and international scientists performing cutting-edge cardiovascular research (in both industry and academia) are invited to present their research and network with the CVI community. By convening thought leaders in cardiovascular science, this seminar series facilitates the initiation of new collaborations and accelerates science at Stanford.

MED223: Cardiovascular Research and Medicine

The focus of the MED223 class, in conjunction with the Cardiovascular and Pulmonary Medicine Scholarly Concentration, is to fine tune critical thinking skills by: analyzing original publications, engaging small group lectures with Stanford faculty, and exposing medical students to the variety of current complexities of the cardiovascular and pulmonary systems.

For more information: http://med.stanford.edu/cvi/education/cvi-courses/med223.html
Vera Moulton Wall Center for Pulmonary Vascular Disease

Who We Are
An international leader in the field of pulmonary vascular disease with an established tradition of innovative research, exceptional teaching, and outstanding patient care. A pioneer of new and novel clinical therapies, the Vera Moulton Wall Center is uniquely positioned to lead the field translating research into effective pulmonary hypertension (PH) therapies.

Our Mission
To eradicate pulmonary vascular disease by discovering fundamental causes, developing innovative therapies, disseminating crucial knowledge, and delivering transformative care.

Our Vision
To transform the way pulmonary vascular disease is understood and treated, both locally and globally.

CURRENT RESEARCH
My research focuses on understanding the molecular mechanisms involved in cardiac amyloidosis, particularly transthyretin amyloidosis. The main goals are to (i) elucidate key determinants of protein misfolding and amyloid formation, (ii) develop biomarkers for early disease detection and monitoring, and (iii) identify novel targets for specific amyloid therapies. To pursue these goals, we use cell- and animal-based models combined with detailed phenotypic profiling of large cardiac amyloid patient cohorts.

Some people want it to happen, some wish it would happen, others make it happen. — Michael Jordan

SELECTED PUBLICATIONS

Christopher Almond, MD
Professor of Pediatrics (Cardiology) at the Lucile Salter Packard Children’s Hospital
Director, Cardiac Anticoagulation Services, Stanford Children’s Health

EMAIL calmond@stanford.edu
PROFILE med.stanford.edu/profiles/Christopher-Almond

CURRENT RESEARCH
Dr. Almond’s clinical research efforts focus on improving outcomes for children with end-stage heart failure, specifically in the areas of pediatric ventricular assist devices, cardiac transplantation, medical management of decompensated heart failure, and anticoagulation. He has a special interest in the design of multicenter clinical trials to evaluate promising drugs and devices seeking FDA approval for rare diseases. Dr. Almond served as the national PI for the Berlin Heart EXCOR Pediatric VAD multicenter clinical trial. He currently serves as PI for the TEAMMATE Trial, a randomized clinical trial evaluating Everolimus to prevent long-term complications after pediatric heart transplantation, and the PumpKIN trial, evaluating the Jarvik 2015, a miniaturized continuous flow durable VAD for bridge to heart transplant in children.

We have had a longstanding interest in how to use ventricular assist devices (VAD) in children, and we want to carry that into the future, as well.

HELIX GROUP http://helix.stanford.edu/

CURRENT RESEARCH

Russ Altman’s primary research interests are in the application of computing and informatics technologies to problems relevant to medicine. He is particularly interested in methods for understanding drug action at molecular, cellular, organism, and population levels. His lab studies how human genetic variation impacts drug response (e.g., http://www.pharmgkb.org/). Other work focuses on the analysis of biological molecules to understand the actions, interactions and adverse events of drugs (e.g., http://feature.stanford.edu/). He helps lead an FDA-supported Center of Excellence in Regulatory Science & Innovation.

SELECTED PUBLICATIONS

Dr Arya’s research is focused on improving quality of care and outcomes in older and high-risk vulnerable patients undergoing surgery. Her health services research lab focuses on how novel risk predictors can be used to guide improvements in patient centered outcomes and healthcare value in this population. She has been funded by the American Heart Association (AHA) grant to develop risk prediction models for cardiovascular outcomes and limb loss in Peripheral Arterial Disease (PAD) patients. She is also funded by the NIH/NIA GEMSSTAR grant studying the impact of frailty on quality of surgical care in PAD and aortic aneurysm patients. Her work addressing the importance of home-time in older adults undergoing surgery is funded by the Center for Innovation and Implementation (Ci2i) at VA Palo Alto. Her accumulated research points to frailty as a versatile tool that can guide surgical decision making, inform patient consent and design quality improvement initiatives at the patient and hospital level.

CENTER familyheart.stanford.edu

CURRENT RESEARCH

My lab is focused on the application of genomics to medicine. We develop methods for the interpretation of whole genome sequencing data to improve diagnosis of genetic disease and to personalize the practice of medicine. We love big data questions and are obsessed with systems approaches to biology especially analysis of network graphs. The wet bench is where we test causality of key genes and investigate the biology of network modules. It is also the focus of our translational efforts. Therapeutic development is a near term goal, and several of our discoveries are the focus of patents or are being actively pursued by pharmaceutical and biotechnology partners.

If your dreams do not scare you, they are not big enough. — Ellen Johnson Sirleaf

Director, Medical & Population Genomics for Precision Medicine, VA Palo Alto Health Care System
Associate Director, Epidemiology Research and Information Center for Genomics, VA Palo Alto Hospital

EMAIL tassimes@stanford.edu
PROFILE med.stanford.edu/profiles/Themistocles-Assimes

CURRENT RESEARCH

My investigative focus is the design, conduct, analysis, and interpretation of human molecular epidemiology studies of complex cardiovascular disease (CVD) related traits including coronary atherosclerosis and risk factors for coronary atherosclerosis. In addition to performing discovery and validation population genomic studies, we use contemporary genetic studies to gain important insight on the causal and mechanistic nature of associations between purported risk factors and adverse cardiovascular related health outcomes through instrumental variable analyses and genetic risk score association studies of intermediate phenotypes. I am also actively involved in studies assessing the clinical utility of novel genetic markers in isolation or in combination with other biomarkers.

To crack the code of complex cardiovascular traits, we need collaborative networks almost as complicated as the biological networks we are trying to understand. The CVI allows such networks to seed and flourish.

CURRENT RESEARCH

My current research focus is applying radiomics and deep learning algorithms to tumor response assessment with computed tomography, positron emission tomography and magnetic resonance imaging. Together with the 3D lab, I am establishing standardized response assessment for different tumor entities and new targeted and immunotherapies with cross sectional imaging for patients in clinical trials. From my former work, my area of expertise includes contrast induced nephropathy, new image reconstruction methods and radiation protection strategies, meta-analysis for the predictive value of cardiac CT, as well as large clinical surveys in the field of radiation exposure habits. My recent publications dealt with the comparison of intravascular ultrasound with computed tomography for the assessment of myocardial coronary artery bridges. My primary clinical focus is cardiovascular and body imaging.

PROFILE med.stanford.edu/profiles/Daniel-Bernstein
LAB murinecvcore.stanford.edu

CURRENT RESEARCH
Our recent work has focused on the mechanism by which mutations in sarcomeric proteins such as myosin lead to the clinical phenotypes of hypertrophic cardiomyopathy (HCM). Utilizing human induced pluripotent stem cell-derived cardiomyocytes, with mutations induced by CRISPR/Cas9 gene editing, we are undertaking a multi-scale approach ranging from structural and function studies on the single myosin molecule, to the individual myofibril, to whole cells and to microengineered tissues. To better understand cardiomyocyte mechano-transduction, we are applying FRET sensors in critical sarcomeric and junctional proteins. We are also studying a large biobank of myocardial samples from patients with HCM, combining transcriptomics and metabolomics with measurements of mitochondrial function to determine the degree to which HCM is a disease of altered cardiac energetics. These studies will allow us to correlate findings from hiPSC-CMs with actual patient samples. Another focus of our lab has been on the molecular mechanisms of RV hypertrophy and its transition to RV failure, and how this differs from LV failure. I am also involved in several clinical/translational projects: a multi-center clinical study to evaluate novel biomarkers for post-transplant lymphoproliferative disorder in pediatric solid organ transplant patients; the Pediatric Cardiac Genomics Consortium, an NIH initiative to sequence 10,000 trios for genes associated with congenital heart disease; and a study to use immune profiling to predict adverse outcomes after pediatric left ventricular assist device (LVAD) implantation.

CURRENT RESEARCH

Dr. Blau’s research area is stem cell biology, aging, and regenerative medicine. She is world renowned for her work on nuclear reprogramming and demonstration of the plasticity of cell fate using cell fusion. Her lab made the unexpected finding that short telomeres are a hallmark of genetic dilated cardiomyopathies and constitute premature aging disorders. Blau’s lab identified biomaterials and molecular regulators that synergize to rejuvenate aged muscle stem cell function, augmenting strength. From these studies, new therapeutic paradigms have emerged for cardiac and skeletal muscle disorders.

We dance for laughter, we dance for tears, we dance for madness, we dance for fears, we dance for hopes, we dance for screams, we are the dancers, we create the dreams. — Albert Einstein

SELECTED PUBLICATIONS

CURRENT RESEARCH

My research focuses on analyzing genome wide patterns of variation within and between species to address fundamental questions in biology, anthropology, and medicine. My group works on a variety of organisms and model systems ranging from humans and other primates to domesticated plant and animals. Much of our research is at the interface of computational biology, mathematical genetics, and evolutionary genomics.

Gerald Crabtree, MD
Department of Pathology Professor in Experimental Pathology and Professor of Developmental Biology

EMAIL crabtree@stanford.edu
PROFILE med.stanford.edu/profiles/Gerald-Crabtree
LAB crablab.stanford.edu/

CURRENT RESEARCH
We are interested in the role of chromatin regulation in development and human cancer. Recent studies have shown that over 20% of all human cancers have mutations in the subunits of an ATP-dependent chromatin regulatory complex we discovered several years ago. The genes behave as tumor suppressors and sometimes as oncogenes. We hope to understand the fundamental mechanisms used by these complex to prevent cancer.

These same chromatin remodeling complexes are frequently mutated in a variety of human neurologic diseases, reflecting their roles in the development of the nervous system. It appears that these specialized roles in the nervous system are due to the use of unique neural specific assemblies in the developing human and mouse brain. We hope to understand their fundamental mechanism of action through biochemical and genetic approaches in combination with genome-wide analysis and genome sequencing studies.

Finally, we are developing new ways of making conditional alleles of mammalian genes using synthetic ligands that we hope will bring about a new fusion of biochemical and genetic approaches to understanding and controlling fundamental biologic processes. Recently we have developed an effective way of both assaying and modifying chromatin regulation in living cells.

SELECTED PUBLICATIONS

CURRENT RESEARCH

Our research focuses on developing biophysical and chemical tools to probe fundamental questions in biology. We bring together state-of-the-art nanotechnology, physical science, engineering, and molecular and cell biology, to advance current understandings of biological processes in neurons and cardiomyocytes. Currently, there are two major research directions: (1) Developing nanoscale tools to probe electric activities and cellular processes at the cell-material interface. In this area, we have developed nanoscale electric probes for measuring intracellular action potentials in electrogentic cells, as well as structural probes and optical probes with high sensitivity and subcellular localization. (2) Employing optical, magnetic, and optogenetic tools to understand nerve growth factor (NGF) signaling in neurons. By adapting a variety of microscopy, optogenetic, nanotechnology and biochemical tools, we aim for a deeper understanding of NGF signaling in normal neurons and neurodegenerative diseases.

Life is like riding a bicycle. To keep your balance, you must keep moving. – Albert Einstein

Medical and Scientific Director, Stanford South Asian Translational Heart Initiative (SSATHI)
Co-Director, Falk Cardiovascular MRI Facility

EMAIL rdash@stanford.edu
PROFILE med.stanford.edu/profiles/rajesh-dash

CURRENT RESEARCH
My research focuses on the prediction of coronary and cardiovascular disease in high risk patient populations, using population health and molecular imaging, as well as digital health technologies to achieve better preventive outcomes. I am Medical and Scientific Director of the Stanford South Asian Translational Heart Initiative (SSATHI). Our mission is to detect, treat, and prevent the onset of coronary and cardiometabolic diseases in young South Asians. We study this problem at the cellular and physiological levels, and validate our discoveries with partners in India. Within SSATHI, I launched CardioClick, a team-based video visit platform for patient visits that include physician visits, lifestyle intervention, and clinical research study conduction. CardioClick has attracted industry clinical sponsorship to test technologies designed for patient engagement and outcome improvement. This telemedicine platform is now being scaled across cardiovascular medicine and SHC. In addition, I study cell signaling in the heart and have developed molecular imaging probes that track to injured heart tissue or transplanted stem cells, such that we can visualize these injury or survival signals in real-time, non-invasively. In this capacity I am Co-Director of the Falk Cardiovascular MRI Facility. I am applying these imaging strategies in select high-risk patients.

Everyone has a plan until they get hit in the face.
— Mike Tyson

CURRENT RESEARCH
My laboratory is interested in the molecular basis of T and B lymphocyte recognition, as well understanding the human immune system and its relationship to health and disease. These later efforts have employed systems biology approaches to understand vaccine responses, twin studies to understand the relative influence of environment versus genetics, and T cell repertoire studies to understand self vs non-self capabilities and the origin of memory T cell responses. By identifying markers that could tell us how a particular person’s immune system is functioning, we could both understand immune system-related and infectious diseases better and formulate new and more efficacious interventions.

By identifying markers that could tell us how a particular person’s immune system is functioning, we could both understand immune system-related and infectious diseases better and formulate new and more efficacious interventions.

CURRENT RESEARCH

My lab focuses on understanding the genetic, cellular and molecular mechanisms involved in the pathogenesis of pulmonary arterial hypertension (PAH). We are interested in understanding how pulmonary arteries respond to injury and identify novel genetic modifiers whose dysfunction can trigger small vessel loss and vascular remodeling in PAH patients. In particular, we are currently focused on exploring how the Wnt signaling pathways regulate the behavior of pulmonary artery endothelial cells (PAECs), smooth muscle cells (PASMCs) and pericytes in response to injury and whether mutations related to these pathways can affect signaling via other pathways relevant to PAH resulting in development of clinical disease. The overarching goal of our work is to identify potential biomarkers and drug targets that can be used in the development of novel diagnostic and treatment approaches to offer patients afflicted with this devastating disease.

Life is too unpredictable to plan ahead: You should be prepared to be surprised every step of the way.

What have we learned in the last 20 years? A Comparison of a Modern Era Pediatric and Congenital Catheter Ablation Registry to Prior Pediatric Ablation Registries. Dubin AM, Jorgensen NW, Radbill AE, Bradley DJ, Silva JN, Tsao S, Kanter RJ, Tanel RE, Trivedi B, Young ML, Pflaummer A, McCormack J, Seslar SP. Heart Rhythm 2018

Observers have noted the central importance of tissue mechanics in health and disease since ancient times. We now know that intrinsically mechanical stimuli such as fluid flow, mechanical stretch, and tissue stiffness play central roles in cardiovascular development, homeostasis, and disease. However, the molecular mechanisms by which cells sense mechanical cues remain poorly understood, due largely to a lack of tools that measure forces inside living cells and tissues. Our laboratory uses genetically encoded molecular sensors to directly visualize mechanical tension in living cells, with the goal of uncovering how mechanical cues regulate stem cell differentiation and self-renewal. In addition, we study how the endothelial cells that line the vascular system sense fluid flow, a fundamental and unsolved question in vascular biology.

The hard and stiff will be broken. The soft and supple will prevail. — Tao Te Ching (trans. Stephen Mitchell)
The Cardiac Magnetic Resonance (CMR) Group develops translational cardiac and cardiovascular MRI techniques to study cardiovascular physiology and improve clinical care. Current research projects focus on: 1) characterizing several cardiac MRI biomarkers to detect the cardiomyopathy associated with Duchenne Muscular Dystrophy; and 2) developing MRI methods and a computational modeling framework to estimate changes in passive ventricular stiffness in patients with Heart Failure with Preserved Ejection Fraction (HFpEF). Our group is also very interested in further developing MRI methods that analyze cardiac structure, function, flow, and remodeling with particular emphasis on pulse sequence and gradient waveform design. One central aim is to increase the quantitative accuracy and reduce the image acquisition times for CMR exams.

The good life is one inspired by love and guided by knowledge. — Bertrand Russell

SELECTED PUBLICATIONS

My research group focuses on the invasive assessment of coronary physiology. In particular, we use coronary wire-based methods to evaluate which coronary artery narrowings are responsible for myocardial ischemia and warrant stenting. We have helped to perform multicenter, international clinical trials examining the role of fractional flow reserve in guiding percutaneous coronary intervention in various patient populations. Through NIH sponsored research, we have also applied these wire-based methods to understand better coronary microvascular function and its role in patient outcomes. For example, in collaboration with other members of the Cardiovascular Institute, we are investigating the effect of PCSK9 inhibition early after cardiac transplantation on coronary physiology and endothelial function.

The saying 'Don't judge a book by its cover' applies to coronary angiography. By invasively assessing coronary physiology, we have learned how misleading the angiogram can be.

CURRENT RESEARCH

My laboratory is developing imaging assays to monitor fundamental cellular/molecular events in living subjects including patients. Technologies such as micro positron emission tomography (microPET), bioluminescence optical imaging, fluorescence optical imaging, micro computerized axial tomography (microCAT), ultrasound, photoacoustics, and Raman imaging are all being actively investigated in small animal models. Our goals are to marry fundamental advances in molecular/cell biology with those in biomedical imaging to advance the field of molecular imaging. We have a particular interest in cancer biology and early cancer detection. Research in early cancer detection and pharmacological therapy assessment is also being performed. Assays to interrogate cells for mRNA levels, cell surface antigens, intracellular proteins and protein-protein interactions are under active development. We are also extending many of these approaches for human clinical applications using optical and PET-CT technologies.

EMAIL cgardner@stanford.edu
PROFILE med.stanford.edu/profiles/Christopher-Gardner
WEB nutrition.stanford.edu

CURRENT RESEARCH
I have been involved in more than a dozen human intervention trials involving more than 2,000 participants. These have examined the potential health benefits of garlic, soy, antioxidants, fish oil, ginkgo biloba, vegetarian diets, and weight loss diets. In the past few years my long-term research interests have shifted to include a second line of inquiry that falls more under the umbrella of food systems research. This shift came from the realization and appreciation that focusing on “health” as a motivator can drastically limit the potential impact for change. This led me to seek out colleagues across all seven of Stanford’s schools, including those in the fields of business, law, education, earth sciences, and medicine, as well as many disciplines from the school of humanities and sciences. My long-term vision is to create a world-class Stanford Food Systems Initiative and build on the idea that Stanford is uniquely positioned geographically, culturally, and academically, to address national and global crises in obesity and diabetes that are directly related to our broken food systems. My current nutrition and food research involves institutional food settings such as universities, worksites, hospitals, schools, and retirement communities. I serve on the Scientific Advisory board of the Culinary Institute of America and have many new colleagues that are chefs who are striving to elevate the unapologetic deliciousness of food, while at the same time including human and environmental health. My long-term goal is to contribute to and accelerate positive changes in the food environment and social norms.

The river delights to lift us free, if only we dare let go. Our true work is this voyage, this adventure.

CURRENT RESEARCH

I have worked in the fields of evidence-based medicine, clinical and molecular epidemiology, human genome epidemiology, statistical methods and mathematical modeling, predictive and personalized medicine and health, and the sociology of science. I have a strong interest in large-scale evidence (in particular randomized trials and meta-analyses) and empirical evaluation of bias in biomedical research. I am interested in understanding how to improve research practices and in the interdisciplinary enhancement of existing research methods for study design and analysis in biomedicine and beyond.

I am privileged to have learned and to continue to learn from interactions with students and scientists from all over the world and to be constantly reminded that I know next to nothing.

SELECTED PUBLICATIONS

Michael S. Kapiloff, MD, PhD
Associate Professor (Research) of Ophthalmology and, by courtesy, of Medicine (Cardiovascular Medicine)

**CURRENT RESEARCH**

Dr. Kapiloff is currently involved in full-time basic science and translational research. His laboratory studies the basic molecular mechanisms underlying the response of the retinal ganglion cell and cardiac myocyte to disease. The longstanding interest of his laboratory is the role in intracellular signal transduction of multimolecular complexes organized by scaffold proteins. Recently, his lab has been involved in the translation of these concepts into new therapies, including the development of new AAV gene therapy biologics for the prevention and treatment of heart failure and for neuroprotection in the eye.

As we acquire a more profound understanding of the molecular underpinnings of the function of our hearts, new therapies will emerge that will provide new hope for diseases that we only assume will take so many of our loved ones away from us.

**SELECTED PUBLICATIONS**

CURRENT RESEARCH

The Karakikes Lab aims to uncover fundamental new insights into the molecular mechanisms and functional consequences of pathogenic mutations associated with familial cardiovascular diseases.

The overarching goal of our studies is to improve our understanding of the pathogenesis of familial cardiomyopathies, such as Hypertrophic Cardiomyopathy (HCM) and Dilated Cardiomyopathy (DCM). We utilize isogenic human induced pluripotent stem cells (iPSCs) as a platform for disease modeling to gain insights on how rare mutations affect the cardiomyocyte biology. By establishing a better understanding of the biology of the disease, our studies represent a first definitive step in elucidating the genotype-phenotype associations in HCM and DCM toward applying a precision medicine approach to the treatment of genetic cardiomyopathies.

SELECTED PUBLICATIONS

As Director of Heart Transplant Research in the Division of Cardiovascular Medicine, my research focuses on the evaluation and selection of donors for heart transplantation; the pathogenesis of post-transplant complications, including acute rejection and cardiac allograft vasculopathy; and non-invasive diagnosis of post-transplant complications. I serve as Associate Director of the International Society for Heart and Lung Transplantation (ISHLT) Thoracic Transplant Registry and as the heart transplant lead for the ISHLT 2020 annual scientific sessions. I am Associate Editor for the American Journal of Transplantation and am on the editorial boards of the Journal of Heart and Lung Transplantation and Circulation Heart Failure. I am also the Program Director of the Advanced Heart Failure and Transplant Cardiology fellowship at Stanford.

PROFILE med.stanford.edu/profiles/brian-kobilka
LAB med.stanford.edu/kobilkalab

CURRENT RESEARCH

The goal of my lab is to characterize the structure and mechanism of activation of G protein coupled receptors (GPCRs). GPCRs are the largest group of cellular receptors for hormones and neurotransmitters in the body. They play central roles in the network of cellular communication that orchestrates the physiological processes essential for life. Disruption of one or more components of this complex communication network can lead to a broad spectrum of diseases ranging from cardiovascular and metabolic disorders, to neuropsychiatric and neurodegenerative disorders. GPCRs are therefore important targets for drug discovery. We apply biochemical and biophysical tools to investigate the molecular mechanism of GPCR signaling in cells, and the structural basis for regulation of GPCR function by drugs. We are also working to discover approaches for the more efficient and economical development of safer and more effective therapeutics targeting these receptors.

It has been a great privilege to be part of the Stanford community, which provides a unique environment for interdisciplinary collaborations, and attracts the most talented and innovative students and fellows.

CURRENT RESEARCH
A major focus of my laboratory is the definition of molecular mechanisms of central nervous system angiogenesis and blood-brain barrier regulation, using knockout mouse and adenoviral approaches. In particular, we have generated conditional floxed alleles for the orphan G-protein coupled receptor GPR124 expressed in brain endothelial cells, revealing embryonic lethality from highly specific developmental CNS angiogenesis phenotypes, and allowing testing of essential requirements of this receptor during adulthood and diseases such as stroke or brain tumors. We are interested in developing novel pharmacologic modulators of blood-brain barrier permeability. We also study the endothelial-expressed miR-126/Egfl7 locus using floxed mouse alleles. Additional parts of the lab work in stem cell biology and 3D organoid culture of diverse human organs. This has led to a strong interest in lung stem cell biology and regenerative medicine.

If we knew what we were doing it wouldn't be called research, would it? — Albert Einstein

LAB med.stanford.edu/ctsurgery/research/leelab.html

CURRENT RESEARCH
My lab is working to advance the understanding of the mechanisms of cardiac arrhythmias and to apply that understanding to develop potential therapies to treat atrial fibrillation and other disorders of cardiac rhythm. We have investigations at the genomic level, whole organ tissue level, and clinical studies in humans. We are developing new high resolution mapping tools to characterize atrial fibrillation, and are using cell culture to examine arrhythmias at the cellular level. Utilizing the knowledge from these investigations, we are also developing minimally invasive surgical techniques to treat arrhythmia.

We have to do better. If our success rates with coronary artery disease were as bad as our results with atrial fibrillation, we would all be out of business.

CURRENT RESEARCH

My clinical research interests focus on developing and refining endovascular techniques to treat complex aortic pathology related to aneurysms and dissections, particularly as Stanford’s local principal investigator for numerous endograft trials, and having also accumulated one of the largest series of fenestrated and snorkel/chimney procedures for juxtarenal aortic aneurysms in the country. As a surgical educator and former Robert Wood Johnson Faculty Physician Scholar, my lab has demonstrated that endovascular simulation for students and trainees translates to increased learner interest, more efficient surgical training, and improved operative performance. We are currently collaborating with multiple institutions designing national standards for technical skills assessment. I am the Director of Endovascular Surgery and Program Director of our top-notch Vascular Surgery Residency/Fellowship.

Don't bet against technology - continued device innovation and technical improvements will provide patients with much less invasive ways to cure their vascular diseases.

CURRENT RESEARCH
As much as half of an individual’s lifetime risk for cardiovascular disease is genetic in nature. My laboratory is focused on defining and understanding the heritable factors which account for this risk. Specifically, we employ agnostic, genome-wide approaches to prioritize candidates for molecular investigation. Currently, our main focus is on a process known as “efferocytosis” (Latin: to carry the dead to the grave) and developing novel translational therapies which can stimulate phagocytic removal of apoptotic debris from the necrotic core of the atherosclerotic plaque.

A man is as old as his arteries.
— Thomas Sydenham (17th Century)

SELECTED PUBLICATIONS

CURRENT RESEARCH

My laboratory studies how thrombin, the key enzyme in the coagulation cascade, interacts with its various substrates to regulate hemostasis, inflammation, and innate immunity. Thrombin interacts with the endothelial cell cofactor thrombomodulin to activate protein C and procarboxypeptidase B (pCPB). Activated CPB inactivates a number of proinflammatory mediators and regulates the proinflammatory activities of thrombin in a homeostatic fashion. I am Chief of Staff, VA Palo Alto Health Care System.

Our long-term goal is to define the molecular links important in the crosstalk between hemostasis, thrombosis, inflammation and innate immunity, thereby developing clinically useful diagnostic and therapeutic reagents.

CURRENT RESEARCH

Our research interests are to explore and create new instrumentation and signal processing algorithm concepts for *in vivo* imaging of molecular signatures of disease in living subjects. These novel cameras efficiently image emissions from molecular contrast agents to probe disease biology in tissues residing deep within the body using measurements made from outside the body. The technology goals are to advance the sensitivity and spatial, spectral, and/or temporal resolutions, to create new camera geometries for special biomedical applications, to understand the entire imaging process comprising the subject tissues, radiation transport, and imaging system, and to provide the best available image quality and quantitative accuracy. The ultimate goal is to introduce these new imaging tools into studies of molecular mechanisms and treatments of disease in living subjects.

EMAIL eflewis1@stanford.edu

CURRENT RESEARCH

Dr. Lewis is an internationally recognized clinical expert in the field of advanced heart failure and transplant management. He has been involved in several clinical trials across the spectrum of cardiovascular diseases that aim to improve patient quality of life. These include several innovative approaches to prevent the progression of disease, reduce the rate of readmission following heart failure hospitalization, improve patient understanding prior to surgical interventions, and improve the clinical usefulness of Quality of Life assessments. Dr. Lewis is also working to leverage novel stem cell interventions for advanced heart failure patients. Over a decade ago, Dr. Lewis initiated a patient questionnaire on symptoms and concerns that became a routine part of care. Later, Dr. Lewis performed a clinical trial with Drs. Eric Velazquez and Robert Califf that examined the effect of nonfatal cardiovascular events on changes in health-related quality of life (JACC: Heart Failure, 2014). This study showed that subsequent nonfatal cardiovascular events resulted in significant worsening of patients’ health-related quality of life. These findings have had profound implications for the design of clinical trials to assess patient-reported outcomes. Dr. Lewis’s subsequent work built on these findings, seeking to improve quality of life assessments and their utility in routine care.

CURRENT RESEARCH

Our laboratory has played an international leading role in the study of amyloid light chain (AL) cardiomyopathy, a rare and fatal form of cardiovascular disease. We have described the underlying pathophysiologic basis for amyloid cardiomyopathy and found that the circulating amyloidogenic light chain proteins that characterize this disease directly result in a specific cardiotoxic response. Consequently, our research work has redefined AL cardiomyopathy and has raised new treatment approaches. In line with our goal of revealing novel therapeutic strategies for patients with cardiovascular disease, our efforts have also focused on characterizing and harnessing endogenous cardiac regenerative mechanisms. Our group initially demonstrated the therapeutic potential of exogenous primitive muscle cells delivered to the injured heart. This work was among the earliest milestones in the field and served as the basis for an international trial of cell-based therapy. We aim to reveal the molecular mechanisms regulating the endogenous regenerative capacity of the heart and to harness such repair mechanisms for the treatment of cardiovascular disease.

CURRENT RESEARCH
My research focus is on the application of novel cell based and bioengineering methods towards understanding and treating ischemic heart disease and heart failure.

SELECTED PUBLICATIONS

Ion transport across the hydrophobic barrier of the cell membrane is a primary challenge faced by all cells. Such transport sets up and exploits ion gradients, thus providing the basic energy and signaling events that are the foundation of life. My laboratory studies the molecular mechanisms of ion channels and transporters, the proteins that catalyze this transport. We use a combination of biophysical methods to investigate membrane-protein structure and dynamics together with electrophysiological analyses to directly measure function. We also collaborate with the Du Bois laboratory (Chemistry) to develop small-molecule tools for studying physiological functions of channels and transporters. Finally, we apply expertise in ion channels towards understanding the mechanism by which ultrasound modulates neural activity. These projects have many potential therapeutic applications in cardiovascular health and disease.

Nothing will work if you don’t.

Nicholas Melosh, PhD
Associate Professor of Material Science and Engineering and of Photon Science

Email: nmelosh@stanford.edu
Profile: med.stanford.edu/profiles/nicholas-melosh

Current Research
The focus of my research is engineering cell access and dynamic bio-electronic interfaces. I am very interested in how to design new structures that will seamlessly integrate with biological systems to address problems in molecular delivery, iPSC development, cell sampling, and electrical recording. This involves both fundamental work such as to deeply understand how lipid membranes interact with inorganic surfaces, electrokinetic phenomena in biologically relevant solutions, and applying this knowledge into new device designs. Examples of this include “nanostraw” drug delivery platforms for direct delivery or extraction of material through the cell wall using a biomimetic gap-junction made using nanoscale semiconductor processing techniques. We also engineer materials and structures for electrical interfaces and highly parallel stimulation and recording. For instance, we have created inorganic electrodes that mimic the hydrophobic banding of natural transmembrane proteins, allowing them to ‘fuse’ into the cell wall, providing a tight electrical junction for solid-state patch clamping. In addition to significant efforts at engineering surfaces at the molecular level, we also work on ‘bridge’ projects that span between engineering and biological/clinical needs.

One of the most exciting developments over the past ten years is the merging of engineered devices and biological problems to make clinical impacts.

CURRENT RESEARCH
Our goal is to discover new therapeutic targets and therapeutics for heart failure, and to remove the adverse cardiac effects of oncology drugs. Over the past two decades, our studies laid the groundwork for the efficient production of heart cells from pluripotent stem cells, and for automated, high throughput screening of genes, proteins and small molecules for the ability to ameliorate disease symptoms. Our current pipeline starts with cardiomyopathy and arrhythmia models generated using patient and genome edited iPSCs and uses them in screens to find new therapeutic targets and develop novel therapeutic strategies. The most advanced projects are now in preclinical, large animal testing.

There is so much we can do now to understand the human condition that would have been unimaginable only a few years ago—in many ways we live in the best of times.

WEB familyheart.stanford.edu

CURRENT RESEARCH

Dr. Marco Perez’s research goal is to better understand the fundamental causes of cardiovascular disease through the study of genetics and epidemiology. His group studies the genetic variations and environmental exposures that are associated with conditions such as atrial fibrillation and heart failure. He has led the studies of atrial fibrillation in Women’s Health Initiative, one of the largest nation-wide population-based cohorts. He is currently conducting a large study monitoring for silent or asymptomatic atrial fibrillation in women from the WHI randomized to exercise intervention, and is co-PI in the Apple Heart Study, a clinical trial using the Apple Watch to screen for atrial fibrillation. He is interested in understanding the paradox that atrial fibrillation is less common in African Americans and Hispanics, despite a greater burden of risk factors such as hypertension. As director of the Stanford Inherited Arrhythmia Clinic, he evaluates families with rare inherited arrhythmias associated with sudden death such as Long QT and Brugada Syndromes and explores their links with novel genes. He is particularly interested in studying the genetic causes of very early onset atrial fibrillation. He also studies how best to use the electrocardiogram to identify patients at risk for atrial fibrillation and athletes at risk for life-threatening arrhythmias due to conditions such as hypertrophic cardiomyopathy. His genetic studies have led to the discovery of promising novel therapeutic targets that his group is now studying at a functional level.

CURRENT RESEARCH

Our research focuses on providing theoretical foundations and engineering innovations for realizing microelectronics that seamlessly integrate with the body. Such systems will allow precise recording or perturbation of physiological processes for advancing basic scientific discovery, and restoring or augmenting biological functions for clinical applications. Although microelectronics can be made extremely small, existing methods for powering them involve large batteries or energy harvesting modules. The size of these powering components severely constrains the integration of microelectronics in living systems. The main thrust of our research aims to address these obstacles through fundamental understanding of power transfer physics with advances in low-power integrated circuits in order to demonstrate the injection of fully operational sensors, electrodes, light sources, and other electronics deep inside the body. An array of these tiny probes enables measurement or perturbation of physiological parameters in previously inaccessible locations and over long time periods.

Angels can fly because they take themselves lightly. — G.K. Chesterton

Professor Quake’s interests lie at the nexus of physics, biology and biotechnology. His group pioneered the development of Microfluidic Large Scale Integration (mLSI), demonstrating the first integrated microfluidic devices with thousands of mechanical valves. This technology is helping to pave the way for large scale automation of biology at the nanoliter scale, and he and his students have been exploring applications of lab-on-a-chip technology in functional genomics, genetic analysis, and structural biology. Professor Quake is also active in the field of single molecule biophysics.

SELECTED PUBLICATIONS

My laboratory is interested in the molecular mechanisms that mediate vascular disease pathophysiology and the risk for these diseases. The approach is primarily genetic, using human cohorts and large scale genome wide studies to identify genes that associate with disease and risk, and molecular genetic studies to define the mechanisms of these associations. At the human level, we collaborate with a number of centers around the world through the CARDIoGRAM+ C4D consortium to further identify coronary heart disease loci, and our group serves as the organizing center searching for loci that associate with gold standard measures of insulin sensitivity, the GENESIS study. For loci identified through these studies, we work to identify mechanisms by which causal variation is responsible for altered gene structure or function, and employ cellular and genetic mouse models to identify how encoded factors participate in the disease process.

When not working on disease genes, I enjoy listening to blues music.

SELECTED PUBLICATIONS

We investigate mechanisms leading to pulmonary arterial hypertension (PAH) with the view that we might better treat this devastating condition that has no cure except for lung transplantation. We discovered relationships between degradation of elastin by an endogenous elastase, loss of pre-capillary vessels, and proliferation of vascular cells and showed that suppression of elastase activity could reverse experimentally-induced PAH; we are now embarking on a translational project to bring elastase inhibitors into the clinic. We focus on inflammation and autoimmunity in PAH. CyToF and multiple high throughput approaches are applied in immunophenotyping patients and experimental models of PAH. In addition, we investigate the use of induced pluripotent stem cells to understand the genetic and epigenetic factors that cause PAH. We recently discovered molecular pathways downstream of bone morphogenetic protein receptor (BMPR)2 explaining how activation of this receptor protects EC from apoptosis preventing obliteration and loss of pre-capillary arteries and attenuates proliferation of SMC and fibroblasts. Using human cells and genetically modified mice, we elucidate interactions between BMPR2 signaling and PPARγ mediated gene regulation. We relate mutant BMPR2 to heightened GM-CSF mediated macrophage recruitment, and PPARγ to DNA damage/repair mechanisms and preservation of mitochondrial function.

CURRENT RESEARCH
I have devoted the last fifteen years of my career to the clinical and translational investigation of lymphatic vascular disease. More specifically, my laboratory and clinical research team focus on: biomarker identification and validation in lymphatic vascular disease; applications of therapeutic lymphangiogenesis; drug therapies for acquired lymphedema; and pharmacologic prevention of cancer-induced lymphedema. Having studied and characterized lymphatic vascular disease in small animal models, we are increasingly attempting to apply these insights to the human clinical problem of lymphedema. In 1995, I co-founded, and currently direct, the Stanford Center for Lymphatic and Venous Disorders, a specialized center for the diagnostic evaluation and focused therapy of lymphedema and allied diseases.

I agree with Woody Allen: 'I don't want to achieve immortality through my work. I want to achieve it by not dying.'

CURRENT RESEARCH
As director of the PACT program for pediatric heart failure and transplantation at Lucile Packard Children's Hospital and Stanford University, I am primarily interested in improving clinical care for children with heart failure and heart transplantation. This includes improving survival and functional outcomes of children treated with mechanical circulatory support; and improved utilization of heart donors. We are actively involved in the creation of a national learning network to share, develop and disseminate best practices in this field as a way of complementing traditional research activities.

CURRENT RESEARCH

My clinical and translational research interests focus on improving the outcomes of newborns, infants, and children following cardiopulmonary bypass surgery for congenital heart defects. Mortality for these patients is fortunately now low, but morbidity related to prolonged ICU stay persists and can have a lifelong impact on neurologic development and functional outcomes.

It is estimated that there are now 2 million people living in the United States with congenital heart disease. More than half of these individuals are now adults. This represents both great success in treating congenital heart disease in children as well as a major challenge for cardiovascular health care providers and the institutions caring for adult survivors.

CURRENT RESEARCH

Precision health relies on the ability to assess disease risk at an individual level, detect early preclinical conditions and initiate preventive strategies. We have used deep longitudinal omics profiling and wearable monitoring to better manage health and make health-related discoveries, to identify relevant molecular pathways associated with standard clinical measures, and to assess the impact of personalized longitudinal big data on a understanding health and early detection of disease. Altogether, we conclude that deep longitudinal profiling can lead to actionable health discoveries and provide important information relevant for precision health.

I'm a believer in the future—genomics will move medicine from 'diagnose and treat' to 'predict and prevent'.

CURRENT RESEARCH

My research focuses on the importance of the Bone Morphogenetic Protein Receptor 2 (BMPR2) signaling pathway in pulmonary vascular disease with a focus on pulmonary arterial hypertension (PAH) and hereditary hemorrhagic telangiectasia (HHT) as well as right ventricular (RV) adaptation to an increased afterload. In 2000, two independent groups discovered mutations in the BMPR2 pathway as the genetic basis for pulmonary arterial hypertension (PAH). Over the past years more mutations, either directly involved in the BMPR2 pathway (ENDOGLIN, ALK1, SMAD9) or indirectly linked to the BMPR2 pathway (CAVEOLIN-1), were discovered, emphasizing the central role of BMPR2 signaling in familial PAH. Furthermore, reduced BMPR2 expression and signaling is a feature of other sporadic or idiopathic forms of PAH. Hypothesizing that increasing BMPR2 signaling might improve PAH, we performed a High-Throughput Screen of FDA approved drugs and identified the immunosuppressive drug FK506 (Tacrolimus) as the main BMPR2 activator. FK506 rescued endothelial dysfunction in PAH, prevented and reversed PH in rodent models of experimental PH (JCI 2013) and reduced the degree of RV cardiac fibrosis. This discovery has led to the compassionate use of the compound in end-stage PAH patients (AJRCCM 2015) as well as a phase II clinical trial to test the safety, tolerability and efficacy of low-dose FK506 in PAH at Stanford (ERJ 2017). A second repurposed drug, Enzastaurin, that reverses experimental PAH by increasing BMPR2 expression through the novel BMPR2 modifier gene FHIT (Fragile Histidine Triad) is ready to be tested clinically. Furthermore, my lab is interested in the molecular and histological events that govern RV failure and recovery using the PA banding and de-banding mouse model that we recently developed as well as the role of the BMPR2 pathway in pulmonary arteriovenous malformations in HHT.

SELECTED PUBLICATIONS

Our general research interest is the structure and function of molecular motors in vitro and in vivo, with emphasis on understanding the molecular basis of muscle contraction. Our major areas of specific interest are the molecular basis of energy transduction that leads to ATP-driven myosin movement on actin, the roles of the myosin family of molecular motors in eukaryotic cells, the regulation of actin and myosin interaction and their assembly states, and the biochemistry and regulation of the attachment of molecular motors to their corresponding cargo.

The detailed understanding we have developed of how myosin transduces the chemical energy of ATP hydrolysis into mechanical movement has led us to our current focus on human hypertrophic cardiomyopathy (HCM) caused by missense mutations in human β-cardiac myosin. Our goal is to elucidate the molecular basis of hyper-contractility seen clinically resulting from HCM mutations. We postulated that a majority of HCM mutations shift β-cardiac myosin heads from a sequestered off-state to an active on-state for interaction with actin, resulting in the hyper-contractility seen clinically. This is different from earlier prevailing views, and is the basis of all of our current research. We now have extensive evidence for this hypothesis using a combination of the various high-resolution technologies we have developed over the years as well as new approaches. Our work is now providing possible paths forward for therapeutic intervention for cardiomyopathy patients.

CURRENT RESEARCH

My research focuses on chronic disease prevention—heart disease, cancer, and osteoporosis—and aging, in both women and men. As Stanford’s principal investigator (PI) of the multi-ethnic Women’s Health Initiative (WHI), I conducted large randomized controlled trials (RCT) of diet, menopausal hormone therapy, and calcium & vitamin D supplementation designed to evaluate population-based strategies to prevent heart disease, stroke, cancer, fractures and dementia, and I mentor Stanford Medicine junior and senior faculty and fellows on WHI analyses. I am currently PI of the large WHI Strong & Healthy (WHISH) RCT testing the hypothesis that physical activity reduces major cardiovascular events in older women; and PI of the Osteoporotic Fractures in Men (Mr OS) Study of bone and muscle loss (sarcopenia) and physical function in older men. I am also founding Director of the Stanford Women’s Health and Sex Differences in Medicine (WHSDM, “wisdom”) Center which funds research and provides an educational program on sex and gender health issues.

Menopausal hormone therapy should not be used to prevent cardiovascular disease in women; the focus should be on lifestyle, i.e., physical activity and weight control.

CURRENT RESEARCH

My research focus is an amalgam of pediatric echocardiography, vascular health in children, and use of the internet to deliver care to children with acquired and congenital heart disease. We have various noninvasive modalities to easily acquire vascular health measures in children. In the past year, we completed a study investigating telehealth interventions in pediatric heart transplant patients to improve their vascular health. We discovered that lifestyle interventions delivered via live-video conferencing is a feasible and maintainable method to manage long-term care in this patient population. We have also completed a pilot home tele-echo study where we taught parents of pediatric heart transplant patients to acquire echo images of their children’s hearts. This study showed that parents are able to acquire reliable images for evaluation by an experienced echocardiographer. Using the same idea of a home-echo, and incorporating other home acquisition of key clinical data such as height, weight, digital cardiac auscultation, and medical history, we hope to show that home tele-clinic visits delivered via live-video conferencing is reliable and clinically comparable to regular clinic visits. Emerging new tools makes the landscape for innovative long-term surveillance care exciting. It is a field with which we hope to explore further to be able to incorporate cost-effective, maintainable, accessible, and specialized care.

SELECTED PUBLICATIONS

As the Clinical Director of the Women’s Heart Health at Stanford, I support several ongoing research studies focusing on women and sex differences in cardiovascular disease. We are studying patients who have chest pain, but normal appearing coronary arteries on angiography to understand sex differences in vascular function abnormalities, such as endothelial dysfunction, microvascular disease, and myocardial bridging. We are also investigating the best therapies for such patients, and have found that mindfulness-based stress reduction may reduce chest pain episodes. In addition, we are investigating the role of insomnia treatment for improving cardiac risk factors, trying to find ways of getting more women to cardiac rehab, and testing interventions to improve the cardiac health of women around the time of pregnancy.

The study of sex differences isn’t just about the study of women. It’s about taking a more careful look at both women and men.

Associate Professor, Medicine - Cardiovascular Medicine
Executive Director, Stanford Center for Digital Health
Chief, Cardiac Electrophysiology at the VA Palo Alto Health Care System

CURRENT RESEARCH

I am a cardiac electrophysiologist, outcomes researcher, and clinical trialist. The goal of my research is to improve the outcomes of the treatment of heart rhythm disorders, with a focus on atrial fibrillation (AF), which affects 5 million Americans and can cause stroke and heart failure. By using large administrative, medical record, registry, and implantable device data, my group takes a “Big Data” approach to fill evidence gaps in understanding quality of care, predicting AF-related complications, and comparing effectiveness of treatment strategies. This has led to important contributions in health services and outcomes research that have reshaped professional society guidelines and clinical practice. More recently, we have extended our work to answer questions regarding atrial fibrillation screening, medication adherence, and digitally-enabled treatment strategies. Dr. Marco Perez and I are co-PIs of the Apple Heart Study, a fully digital and virtual end-to-end study to evaluate whether smartwatches can effectively and accurately identify atrial fibrillation. This work has allowed a large team at Stanford to develop the infrastructure for pragmatic studies using smartphone applications and wearable sensors and devices.

Atrial fibrillation is one of the most commonly treated conditions in all of health care. Yet, it is astonishing how little we understand the disease, how to best treat it, and who is at highest risk for complications.

CURRENT RESEARCH

My lab actively collaborates with many investigators on the Stanford campus, and across the world to disseminate and implement newly-invented technologies. We study autoimmune diseases, including systemic lupus erythematosus, rheumatoid arthritis, scleroderma, myositis, primary biliary cirrhosis, Sjögren’s disease, type 1 diabetes, vasculitis, multiple sclerosis, and mixed connective tissue disease. In addition to better understanding the pathogenic mechanisms involved in autoimmunity, we are developing bench-to-bedside technologies for immune diseases. Our group made several breakthrough inventions, such as protein arrays, peptide arrays, HIT, lysate arrays, Intel arrays, and EpiTOF. Additionally, I am Director of the Leadership Center of Francis Collins’ $41M Accelerating Medicines Partnership in RA/SLE initiative.

I am Founder and Program Director for the Stanford Institutes of Medicine Research (SIMR) Program for high school students, which has hosted ~900 students in labs over 20 years. I also developed the Stanford EXPLORE Lecture Series. This program covers the basic science fundamentals represented by various research areas at Stanford Medicine. In 2018, I was appointed Stanford Associate Dean for Medical Student Research to promote physician investigator development across the physician-scientist career continuum. I will continue to provide high-level oversight of SIMR and the MSTP while focusing on new efforts to create programs such as a new Physician Scientist Career Development Program and Berg Scholars Program for MD students to build careers as investigators and leaders.

SELECTED PUBLICATIONS

Paul J. Wang, MD

Director, Stanford Ludwig Center for Cancer Stem Cell Research and Medicine

EMAIL: irv@stanford.edu
PROFILE: med.stanford.edu/profiles/Irving-Weissman
LAB: stemcell.stanford.edu/about/Laboratories/weissman

CURRENT RESEARCH

My laboratory studies stem cell biology and regenerative medicine. We are particularly interested in hematopoiesis, hematopoietic stem cells (HSCs), leukemia, and the clonal events leading from HSC to leukemia. Our research encompasses the phylogeny and developmental biology of blood-forming cells and immune systems. My laboratory was the first to identify and isolate the blood-forming hematopoietic stem cell (HSC) from mice, and we have defined, by lineage analysis, the stages of development between the stem cells and mature progeny. We also discovered the human HSC, a human brain-forming stem cell population, mouse skeletal muscle stem cells, and an osteochondral stem cell in mice. Another research focus of my laboratory is cancer stem cell biology. In recent years, we have studied the potential of CD47 (a molecule on the surface of cancer stem cells that protects them by providing a ‘don’t eat me’ signal to phagocytic cells of the innate immune system) as a cancer therapeutic, and identifying cancer stem cells from a variety of blood and solid cancers.

In every aspect of stem cell and progenitor cell biology, and it’s applications to regenerative medicine, I believe it must start with purification, purification, and purification; substituting impure or unsubstantiated cell populations will in the end only confuse the scientist and the clinical trialist.

DIVISION immunology.stanford.edu

CURRENT RESEARCH

My laboratory examines autoimmune and autoinflammatory disease, with emphasis on immune defects in vasculitis, coronary artery disease and rheumatoid arthritis. The heart of this work is to develop new strategies to suppress unwanted inflammation and to boost beneficial immune responses. We have approached this goal by defining and characterizing immune defects on a mechanistic level and by bed-to-bench and bench-to-bed translation. In large vessel vasculitis, we have defined mechanisms that protect the vessel wall from inflammatory attack and have characterized how the immune privilege of the vessel wall breaks down to enable vasculitis. Vasculitogenic T cells aberrantly express the oncogene NOTCH1, and vasa vasorum endothelial cells express the NOTCH ligand Jagged1. Also, deficiency of the immuno-inhibitory PD1/PD-L1 checkpoint causes unleashing of auto-aggressive T cells. Rheumatoid arthritis is an autoimmune disease associated with high cardiovascular risk. A molecular hallmark of the disease is the metabolic reprogramming of T cells and macrophages. We have assigned defects in bioenergetic regulation to mistrafficking of intracellular proteins, lysosomal dysfunction and insufficient mitochondrial DNA repair. We have described that loss-of-function of DNA repair molecules leads to telomeric instability, abnormal cell cycle progression and premature aging of the immune system. Immuno-aging results in the co-existence of immune failure with uncontrolled inflammation. Our current studies explore how defined tissue niches instruct tissue-dwelling immune cells to sustain inflammation, how the DNA repair machinery controls the immune aging process and how bioenergetic strategies determine cellular behavior.

The immune system is everywhere. All diseases have their roots in the immune system.

CURRENT RESEARCH

My research laboratory seeks to identify mechanisms responsible for human congenital heart disease, the most common cause of still-births in the U.S. and one of the major contributors to morbidity and mortality in infants and toddlers. We believe that by understanding the mechanisms regulating growth and differentiation of heart precursor cells during early embryonic development we can then apply these principles to understand the pathogenesis of adult onset heart diseases such as heart failure and arrhythmia where re-activation of early embryonic developmental program plays a central role. We currently use both genetically-modified mice as our living model to understand the biology of heart development as well as stem cells as a test-tube model to study the process of heart cell formation. In addition, we are using human induced pluripotent stem cells from patients with heart diseases to address the mechanism of their disease formation and to develop new treatments involving engineered 3D tissue for therapy.

CURRENT RESEARCH
A bioengineer by training, I work at the interface of biomaterials, stem cell biology, engineering, and medicine. Using an interdisciplinary approach, my research seeks: (1) to decipher how interactive microenvironmental cues (cell-matrix or cell-cell interactions) regulate cell fate during normal tissue development and during disease progression (cancer), and (2) to develop novel biomaterials and stem cell-based therapeutics to improve tissue regeneration. Using biomaterials-mediated approaches, my lab employs two strategies to engineer stem cells: from the "outside in" via novel scaffold design and from the "inside out" via non-viral gene delivery. In the first strategy, we engineer injectable hydrogels using a “lego-building” approach in order to independently tune cell-niche properties including biochemical, mechanical, and topographical cues. These biomaterials are useful for elucidating the mechanisms of multifactorial cell-niche interactions, and for enabling desirable cell fates and tissue regeneration with particular functions. In the second strategy, we harness the ability of stem cells to home to diseases sites and their ability to enhance tissue regeneration via paracrine signaling. We further modulate the paracrine signaling of stem cells using biodegradable polymeric nanoparticle-mediated non-viral gene delivery, which is safer than conventional viral vectors. Using relevant animal models, we have demonstrated the potential applications of such stem cell- and biomaterials-based strategies for treating musculoskeletal diseases, cardiovascular diseases, and cancer.

SELECTED PUBLICATIONS

Our research interest focuses on the fundamental molecular and cellular processes of myocardial regeneration and restoration. We employ novel in vivo multi-modality molecular and cellular imaging technology to translate basic discovery in stem cell biology. Autologous iPSCs are considered a potential landmark solution. Translational effort of this revolutionary biology is investigated through the secretomes generated from patient- and disease-specific iPSC-cardiovascular cells and their molecular cargo to implement precision medicine. Through NIH/NHLIB-sponsored Cardiovascular Cell Therapy Research Network, the feasibility of a pilot clinical trial of this innovative therapeutic approach is investigated.

Success consists of going from failure to failure without loss of enthusiasm. — Winston Churchill

CURRENT RESEARCH
Current research in the Zare lab explores wide-ranging questions in physical and analytical chemistry, from the study of elementary chemical reactions to chemical analysis of extraterrestrial materials. The major focus of these efforts is chemical analysis on the nanoscale. The team has devised tools and techniques to examine molecules in extremely tiny volumes — the volumes characteristic of what is found in heterogeneous structures in mineral samples or in the contents of cells and subcellular compartments. Group members have also made contributions to understanding chemical reactions in microdroplets.

SELECTED PUBLICATIONS

Stark-induced Adiabatic Raman Passage Examined Through the Preparation of D(2) (v=2, j=0) and D(2) (v=2, j=2, m = 0). Perreault WE, Mukherjee N, Zare RN. J Chem Phys. 2019 Jun 21;150(23):234201.

Selective Synthesis in Microdroplets of 2-Phenyl-2,3-dihydrophthalazine-1,4-dione From Phenyl Hydrazine With Phthalic Anhydride or Phthalic Acid. Gao D, Jin F, Yan X, Zare RN. Chemistry. 2019 Jan 28;25(6):1466-1471.
