Motivation

I am afraid of this evaluation process. The diagnosis depends on me, what I say and I don't trust myself with anything, I never had. I say something one moment but later it's not what I feel so how will they know. I want them to use machines / technology to examine my brain to really know what is wrong with me.

Patient during residency

Take Home Points

- Interventional psychiatry is an emerging field with much potential
- To personalize and increase efficacy, we need to fill large gaps:
 - Objective brain biomarkers to monitor during treatment
 - Map brain biomarkers to multidimensional stimulation space
 - Optimize real-time monitoring for adaptive or closed-loop stimulation
- Personalized treatment with minimal side effects that can be applied to any brain circuit for any neuropsychiatric disorder

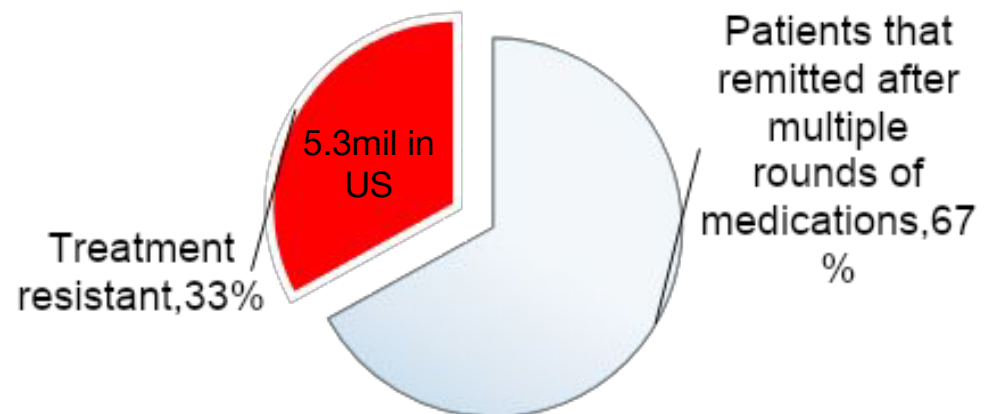

Depression – a leading cause of disease burden

Vohringer PA, Ghaemi SN (2011)
healthline.com; salusworld.com; bbrfoundation.org

Effect of COVID on mental health

'the percentage of adults with recent symptoms of an anxiety or a depressive disorder increased from 36.4% to 41.5%'

Data extrapolated from STAR*D report

The age of interventional psychiatry for TRD

Transcranial Magnetic Stimulation (TMS)

Other Brain Stimulation Methods

Current state of TMS for depression

✓ Clinical efficacy for depression (25-50%)

O'Reardon et al 2007 Biol Psych

George et al 2010 Arch Gen Psych

Fitzgerald et al., 2016 Depression and Anxiety (Metaanalysis)

Kedzior et al., 2015 Depression and Anxiety (Metaanalysis)

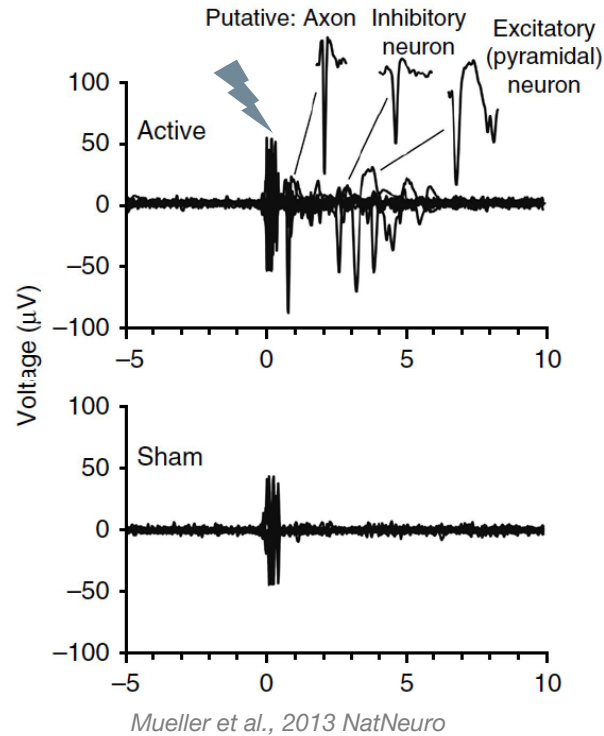

✓ Interesting novel treatment patterns

Mechanistic understanding

Brain markers to stratify, predict, and track

Selectively modulate brain marker

Single pulse TMS generates action potentials and MEPs

Fitzgerald et al., 2013, Schiz Bulletin

Repetitive TMS (rTMS) – modulating brain networks?

Abnormal brain networks in depression

Fischer*, Keller*, Etkin, 2016 *Biol Psych CNI*
Liston et al., 2014 *BiolPsych*

TMS: Selective manipulation of specific brain circuits

Unlimited applications with minimal side effects

Psychiatric disorders

- **MDD (2008)**
- **OCD (2018)**
- **Smoking cessation (2021)**
- PTSD
- Substance use disorder
- Bipolar disorder
- Schizophrenia

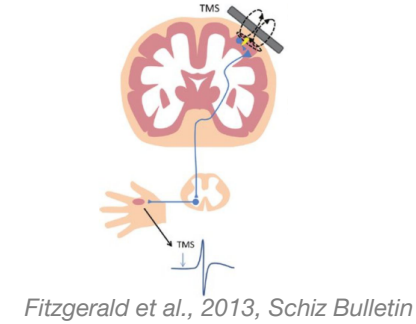

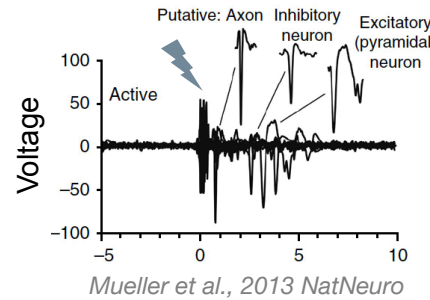

Neurologic disorders

- **Migraines (2013)**
- Alzheimer's
- Epilepsy
- Parkinson disorder
- Stroke

Basic neuroscience

We need to learn the language of TMS

We know the sound of TMS...

We have a few words...

mein mein mein mein mein mein mein mein

bablos bablos bablos bablos bablos bablos

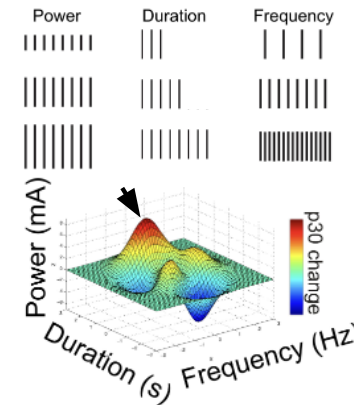

We are missing **everything** else (words, form, content, use)

frequency
 amplitude
 duration
 pattern
 state

location

Personalized Adaptive

Cole et al., 2020/2021 AJP

Next generation brain stimulation: personalized + adaptive

Current v1.0: open-loop

- Largely same as 2008 approval
- Blind to one's physiology / plasticity
- One size fits all

v2.0: Adaptive, closed-loop

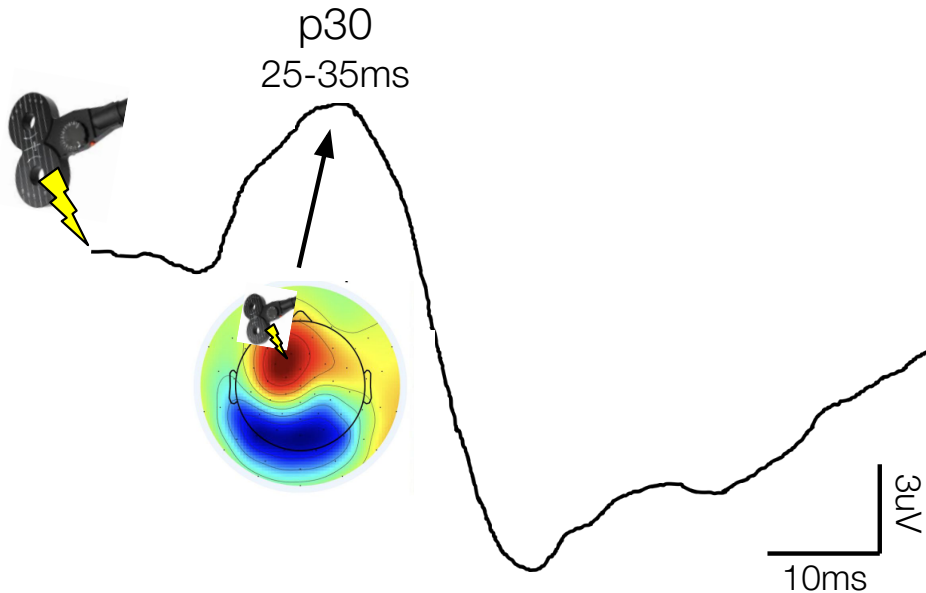

- Adapt tx based on biomarker
- Based on one's physiology / plasticity
- Faster and (much) more effective

TMS-EEG 'p30': a biomarker for TMS

- Causal perturbation
- Millisecond time resolution
- Clinic-ready
- Relatively inexpensive

'p30'

- Earliest discernable peak in TMS-EEG
- Present in invasive and noninvasive EEG recordings (Keller et al., 2018)
- Reflects brain excitability (Tremblay 2015, Lioumis 2009)
- Suppressed after 10Hz TMS in healthy controls (Donati et al., in prep)
- Suppressed after 4 weeks of 10Hz TMS for depression and related to clinical outcome (Eshel et al., 2020)

Multidisciplinary lab approach focused on neuromodulation and human electrophysiology

We deconstruct brain stimulation to establish the fundamental mechanisms underlying human neuroplasticity and develop real-time, closed-loop treatments for mental health disorders

- 1) To develop novel methods to probe the human brain in a causal and directional manner
- 2) To better understand the mechanisms underlying human brain plasticity
- 3) To create real-time, closed-loop solutions for mental health disorders

Non-invasive Brain Stimulation 2.0: biologically-based, personalized, adaptive

- Develop brain biomarker to track brain change → symptoms (Goal 1)
- Understand how stimulation parameters affect brain biomarkers (Goal 2)
- Develop real-time monitoring and closed-loop stimulation (Goal 3)
