**Ear Flushes**

**Important:** Ear flushes should only be performed if prescribed by your physician. You can damage your ear and/or your hearing if you do this when you shouldn’t!

What you need for Ear Flushes:

<p>| | | |</p>

</tr>
</thead>
<tbody>
<tr>
<td>Boric Acid Powder</td>
<td>White Vinegar</td>
</tr>
</tbody>
</table>
How to Prepare Ear Flush Solution:

For rubbing alcohol - white vinegar: Mix 50-50

For rubbing alcohol – boric acid: Teaspoon in powder while stirring until no more goes into solution

Leave the solution on the counter so it stays at room temperature.

How to Flush Your Ear:

Flush the ear repeatedly by vigorously squirting the solution in your ear several times. Most people do this over the sink with a towel on their shoulder. After flushing, dry the ear with a hair dryer on low heat setting.

How Often to Flush Your Ear:

With a stubborn infection, your doctor may recommend flushing twice a day. In those who are infection prone, some folks flush once a week or once a month.

If you use vinegar, you can use this as much as you want. However if you use boric acid, please do not use it more than once a week. The boric acid precipitates and can build up to plug the ear canal if used too frequently.

Why Ear flushing?

The alcohol dries the ear and kills both bacteria and fungi. The boric acid or vinegar acidifies the ear making it a less hospitable place for bacteria and fungi to grow.

If it Stings when you Flush:

An inflamed ear may sting a bit at first, but usually “toughens up” over time. If it really hurts, alcohol based flushing may not be the best choice for your ear – discuss with your doctor.

If Flushing makes you Dizzy:

Try warming the solution filled ear syringe under warm water before flushing. Because alcohol is flammable, do not heat on a stove or microwave.

If your outer ear becomes dry or chapped:

Dab some baby oil on the dry areas after flushing.
