

Do you have a child (2-3 years old) with autism and want intensive center-based intervention?

Stanford University researchers are recruiting children with autism and their parents to participate in a study examining the effectiveness of a center-based Pivotal Response Treatment (PRT) program in targeting social communication abilities in young children with autism.

Participants must:

- Be diagnosed with Autism Spectrum Disorder
- Be between the ages of 2 years and 3 years 11 months
- Be able to attend 3-hour research treatment sessions 4 days per week and participate in parent training at Stanford
- Children who are eligible based on behavioral screening assessments will be randomly assigned to either a 3-month delayed treatment or an immediate treatment group
