Transcranial Magnetic Stimulation (TMS) for Restricted & Repetitive Behavior in Autism

Stanford University researchers are recruiting individuals with an autism spectrum disorder diagnosis between 12-45 years old for a research study to examine the efficacy of TMS for restricted and repetitive behavior in ASD.

Participants must:
- Be willing to receive TMS sessions for up to 6 weeks
- Be willing to participate in behavioral and cognitive testing
- Have no history of epilepsy, no implanted metal and no active medical problems

There is no cost to participate in this study.
