

Do you have a child (2-5 years old) with **autism** and want an intensive center-based or in-home intervention?

Stanford University researchers are recruiting children with autism and their parents to participate in a study examining the effectiveness of a center-based vs. in-home Pivotal Response Treatment (PRT) program in **targeting social communication abilities** in young children with autism.

Contact study coordinator,
Allie Aarrestad, at

or
autismdd@stanford.edu

*For questions regarding
participant's rights,
contact 1-866-680-2906.*

Participants must:

- Be diagnosed with Autism Spectrum Disorder
- Be between the ages of 2 years and 5 years 11 months
- Be able to attend 3-hour research treatment sessions 4 days per week and participate in parent training

Children who are eligible based on behavioral screening assessments will be randomly assigned to either center based intervention, in-home intervention, or treatment as usual. Those assigned to the treatment as usual group will receive treatment after the 16-week period is completed.

Cost of services varies based on individual family health insurance plans.
