Stanford School of Medicine

Jennifer Keller, PhD

Clinical Associate Professor, Psychiatry and
Behavioral Sciences, Stanford School of Medicine

Clea C. Sarnquist, DrPH, MPH

Clinical Associate Professor, Pediatrics (Infectious
Diseases), Stanford School of Medicine

Talk Description:

Gender-based violence (GBV) exacts a high price on the health and well-being of adolescents and adults worldwide. It frequently causes physical and emotional injury, severe stigma, and reduced life-long education attainment and economic potential. It can also result in unplanned pregnancy and sexually transmitted infections, including HIV. Increasingly, there is recognition that equity is not possible without addressing GBV explicitly, as it is an important factor in many other negative physical and mental health outcomes.

In a major breakthrough, randomized trials have started demonstrating there are interventions that can be used to reduce the rate of gender-based violence. In this talk, participants will first learn about the “big picture” of GBV prevention, then move into case-based discussions of adolescent GBV prevention programs in three different settings. The speakers will then synthesize all of the learning into a larger discussion of best practices and directions for future practice and research.
