Forms

Use Forms to collect user data via email to any address you choose. Forms are built by adding individual fields to create a customized intake message. A sample contact form is included with new site templates.

Features

• Form fields include text, radio, checkbox and dropdown
• Custom mailTo and Subject configurations
• Custom Thank You redirect page

Open communication channels using email forms

Pro Tips

• Configure the Form Container first, then insert desired fields
• Email intake is convenient but not ideal for sensitive data and analysis
• Add Google Recaptcha component for heightened security
• Consider embedding a Qualtrics form using the External component

Note: This form uses 3 Text Fields (Email, Subject, Message) within a single Container. Each field demonstrates a different configuration option.
Setup Essentials & Legend

Forms require at least 2 separate components to function: the Form Container and at minimum 1 content field (e.g. Text Field) within. First, add the Form Container, then insert the desired content field(s) between the Start and End of the Container.

- In the Form Start, select Action Type: Stanford Secure Email (A)
- In the Form End, select Show Submit Button (A)

Multiple content field types are available (Checkbox, Dropdown, Radio, Text), yet they all contain similar configurations to the Text Field.
