Introduction

- ▶ Pulmonary arterial hypertension (PAH): PAP > 25 mmHg and PVR > 3 WU
- ▶ Progression is highly variable and poorly understood (5-year survival rates: 60-70%).
- ▶ Endpoints are not well characterized in children (e.g. 6MW).
- ▶ Need improved clinical markers

Van Loon et al., Circulation, 2011

- ▶ Pressure-volume (P-V) loops characterize ventricular performance.
- ▶ Right ventricular stroke work (RVSW): area enclosed by the P-V loop

- ▶ Pressure-volume (P-V) loops characterize ventricular performance.
- ▶ Right ventricular stroke work (RVSW): area enclosed by the P-V loop
- ▶ P-V loops are difficult to measure routinely.

Magnetic Resonance Imaging Analysis of Right Ventricular Pressure-Volume Loops

In Vivo Validation and Clinical Application in Patients With Pulmonary Hypertension

Figure 1. Representative MRI-derived volume-time and pressure-time curves of patient with RV pressure overload.

TABLE 2. Indexes of Ventricular Systolic Pump Function and Hypertrophy

	Control Group	PHT Group
RV		
EF, %	56.4±4.2	62.3±5.1*
SV, mL/m ²	33.4±3.9	28.2±4.9*
CI, L · min ⁻¹ · m ⁻²	2.9±0.4	2.2±0.5*
EDV, mL/m ²	59.5±4.2	46.2±5.9*
ESV, mL/m ²	26.2±2.5	18.3±3.1*
Free-wall myocardial mass, g (mg)	21.6±5.9	39.1±6.1*

TABLE 3. Indexes of RV Contractile Function and VA Coupling

	Control Group	PHT Group
Fiber stress at end systole, mm Hg	125±23	280±31*
Fiber stress at end diastole, mm Hg	15±4	23±6
E _{max,j} , mm Hg · mL ⁻¹ · 100 g ⁻¹	5.2±0.9	9.2±1.1*
E _{0j} , mm Hg/mL	0.6±0.3	2.7±0.6*
E _{max} /E _{0j}	1.9±0.4	1.1±0.3*

*Significantly different ($P < 0.05$) between control and PHT groups.

- ▶ Pressure-volume (P-V) loops characterize ventricular performance.
- ▶ Right ventricular stroke work (RVSW): area enclosed by the P-V loop
- ▶ P-V loops are difficult to measure routinely.
- ▶ Goals: assess RVSW in pediatric patients with PAH:
- ▶ $RVSW = \int_0^T P(t)V(t)dt$, $RVSW_{BSA} = \frac{RVSW}{BSA^{1.407}}$
- ▶ $RVSW_{EF} = \frac{RVSW_{BSA}}{EF}$

Methods

- ▶ Use computational modeling+routinely measured clinical data
 - ▶ Lumped parameter model (LPM): use electric circuits to model hemodynamics
 - ▶ Right heart catheterization (RHC): RV and PA pressures
 - ▶ MRI: RV volumes (EDV and ESV) and PA flow
- ▶ Tune LPM to match RHC/MRI measurements by optimization.

Study Design

	Stable n=9	Worsening* n=8
Male	n=4	n=4
Age (years)	10.7(4.9-16.3)	8.4(4.4-13.5)
BSA (m^2)	1.0(0.6-1.7)	0.9(0.7-1.8)
IPAH	n=5	n=7
Prostacyclin therapy	n=3	n=7
Follow-up (years)	4.2(1.2-8)	3.7(1.1-6)
PVRI ($WU \times m^2$)	6.8 (5.2-31.6)	14.8 (8.1-24.7)
RVEF (%)	48(30-55)	48(18-54)

- ▶ Inclusion criteria
 - ▶ Age < 18
 - ▶ IPAH or PAH-CHD
 - ▶ multiple paired RHC/MRI ($n \geq 2$)
- ▶ 17 patients with 61 data points
- ▶ *Clinical worsening: death, listed or considered for transplantation, poor hemodynamic responses to maximal therapy

Results

a) Stable

b) Worsening

► Patients with clinical worsening have increased RVSWEF.

Results

a) Stable

b) Worsening

- ▶ Patients with clinical worsening have increased RVSWEF.
- ▶ Quantities of interest are grouped and compared by outcomes (stable vs clinical worsening) within 2 years following RHC/MRI.

Results

a) Stable

b) Worsening

- ▶ Patients with clinical worsening have increased RVSWEF.
- ▶ Quantities of interest are grouped and compared by outcomes (stable vs clinical worsening) within 2 years following RHC/MRI.
- ▶ A linear mixed model is used to test the associations between predictors and outcomes.

Results

Results

- ▶ $RVSW_{EF}$ is an independent predictor.

Receiver operating characteristic (ROC)

- ▶ TPR: true positive rate=sensitivity, FPR: false positive rate=1-specificity
- ▶ RVSW outperforms PVRI and Rp:Rs for predicting worsening 2 years following RHC/MRI (AUC: 0.86 vs 0.74 vs 0.79).
- ▶ Cutoff values for 90% spec. RVSW=8593,PVRI=19, Rp:Rs=1.1

Receiver operating characteristic (ROC)

	1 year following MRI/RHC				
	$RVS_{W_{EF}}$	PVRI	Rp:Rs	EF	EDVI
AUC	0.93	0.78	0.83	0.83	0.88
Cutoff values	10027	22	1.29	37%	126
Sensitivity	0.67	0.2	0.17	0.67	0.83
	2 years following MRI/RHC				
	$RVS_{W_{EF}}$	PVRI	Rp:Rs	EF	EDVI
AUC	0.86	0.74	0.79	0.74	0.76
Cutoff values	8593	19	1.1	37%	125
Sensitivity	0.62	0.39	0.38	0.38	0.54
	5 years following MRI/RHC				
	$RVS_{W_{EF}}$	PVRI	Rp:Rs	EF	EDVI
AUC	0.85	0.78	0.83	0.69	0.73
Cutoff values	8160	19	1.1	34%	122
Sensitivity	0.6	0.32	0.36	0.24	0.44

ORIGINAL ARTICLE

RV stroke work in children with pulmonary arterial hypertension: estimation based on invasive haemodynamic assessment and correlation with outcomes

Michael V Di Maria,¹ Adel K Younoszai,¹ Luc Mertens,² Bruce F LandeckII,¹ D Dunbar Ivy,¹ Kendall S Hunter,³ Mark K Friedberg²

RVSW=mPAPxSV

Cath derived mPAP

Echo derived SV

- RVSW is associated with WHO classification.
- RVSW is reduced in class IV.
- RVSW was not found to be superior to PVRI.
- RVSW by mPAPxSV might underestimate RVSW by up to 35%.

Figure 1 Indexed RV stroke work (RVSW) by WHO class. When grouped by WHO heart failure class, there was a significant difference in indexed RVSW ($p=0.04$). RVSW appeared to trend upward in WHO classes 1, 2, and 3, but showed a decline in WHO class 4. Box plots presented here feature the median as a horizontal line within the box, while the box itself represents the IQR (25–75th); the 'whiskers' represent the bounds of the extreme values in which $Q3+1.5(Q3-Q1)$ and $Q1-1.5*(Q3-Q1)$, respectively, and single points are, therefore, outliers.

Di Maria et al., Heart, 2014

Conclusions

- ▶ Patient specific RVSW and P-V loops can be modeled easily.
- ▶ RVSW correlates with symptomatic/disease worsening in pediatric PAH.
- ▶ RVSW outperforms PVRI and Rp:Rs for predicting clinical worsening in pediatric patients with PAH.
- ▶ Future studies will include validation and a larger cohort of patients.
- ▶ Translate computational modeling into clinical practice: a web site/mobile app based risk calculator for PAH patients.
